Major Findings and Recommendations

Discussion

This is the 2005 report of Mercer Oliver Wyman Actuarial Consulting, Inc. (Mercer) to the Commonwealth of Virginia, State Corporation Commission, Bureau of Insurance regarding the adequacy of the funding of the Virginia Birth-Related Neurological Injury Compensation Program (the Program). This report provides our evaluation of the actuarial soundness of the Virginia Birth-Related Neurological Injury Compensation Fund (the Fund) as of December 31, 2004, and our forecasts of the actuarial soundness of the Fund as of each subsequent year-end through December 31, 2007.

As of December 31, 2003, there were 87 admitted claimants of whom 61 had been in the Program for at least three years. As of December 31, 2004, there were 97 admitted claimants, of whom 68 had been in the Program for three or more years. Therefore, the amount of information on payments made by the Program on behalf of individual claimants continues to grow and increase in statistical credibility from one year to the next.

This current study is based on a detailed analysis of payments made on behalf of each of the 68 claimants who had been in the Program for three or more years as of December 31, 2004. The claimants’ actual mortality has continued to be less than expectations, and we have therefore revised our mortality assumptions to reflect longer life expectancies. Further, nursing costs increased significantly during 2004, and we have reflected this increase in our forecasts. As a result of this analysis, we have estimated future payments for eligible claimants born on or before December 31, 2004 that represent an increase of approximately 10 percent over the future payments that we estimated in our prior study dated September 2004.
There are three changes in our methodology, as compared to our September 2004 study:

- We have revised the mortality table, increasing the estimated life expectancies of the claimants in the Program. In our 2005 study, we revised the mortality table for all years of a claimant’s life, which differs from our approach in previous reports in which we effectively only modified mortality for ages 15 and over. We discuss our mortality table revisions in greater detail on pages 37 - 41.

- We have revised our methodology for projecting non-claimant administrative expenses for the years 2005-2007. In last year’s report, we forecasted non-claimant administrative expenses by budgeting on an item by item basis. In this report, we project that approximately 20 percent of annual administrative expenses of $650,000, or $130,000 per year, is non-claimant related. This revision is discussed on page 53.

- We have revised our methodology for calculating the present value amount for lost wages per Group C claimant. In prior studies, we had estimated the Group C present value amount for lost wages based on the amounts for Group A and B claimants. This year, we have revised our methodology to reflect our assumption that the average age of all IBNR claimants as of 12/31/04 is less than the average age of both the Group A and B claimants. This revision is discussed on pages 30 and 31.

All of our assumptions are discussed in detail in the section of this report titled Method and Assumptions.
As stated above, the claims experience of the Program is becoming increasingly credible. Nevertheless, our estimates are still subject to significant uncertainty:

- The Program started in 1988, and as of December 31, 2004 only one living claimant was over the age of 16. Because this claimant has been institutionalized for several years, at no cost to the Program, there is no reliable expense history for this claimant. Thus, there is no claim payment experience for claimants over the age of 16 upon which to base our forecasts of future payments for the period in which claimants are 16 and older. Also, only 68 claimants had been in the Program for three or more years as of December 31, 2004. Further, there is considerable variability in the actual payments that have been made to the 97 claimants admitted as of December 31, 2004.

- In addition, other factors could have a significant impact on future claim payments. For example, there may be changes in the way the Program is operated in the future, the degree to which claimants utilize the services of the Program, and the coverage provided by private health insurance and Medicaid, which are the claimants’ primary funding sources. In addition, actual rates of inflation and interest may differ significantly from the long-term rates that we assumed for our forecast.

The impact of these factors on our estimates is discussed further in the Sensitivity Testing section of this report. We expect to continue to refine our estimates as the experience of the Program unfolds, and these future refinements could have a significant impact on future estimates of the financial soundness of the Fund.

Overall, our estimates of future costs are higher than were anticipated as of our September 2004 report. We have increased our projections due to the increases in nursing costs observed in 2004. In 2004, the Program paid $4.4 million in nursing, compared to $3.0 million in 2003. Based on our conversations with management of the Program, we understand that a substantial portion of the increase in nursing expenses was due to an existing demand for additional nursing services that had not been supplied by the nursing community until recently. We assume that the higher level of nursing services utilized by claimants in 2004 represents a one-time shift to a higher level of nursing
services, and is not indicative of an underlying upward trend in annual claimant nursing expenses that will continue in subsequent years.

The increases in nursing expenses in 2004 for the A claimants (those claimants who have been in the Fund for at least three complete years), essentially drive our forecasts for the B claimants (those in the Fund for two or fewer complete years) and the C claimants (those born, but not yet admitted to the Fund). The results of these higher nursing costs and how they have impacted our forecasts are most easily seen in our treatment of the C claimants. In this year’s report, our forecasted lifetime costs per group C claimant have risen to $1.97 million, representing an increase of approximately 12 percent over last year’s projected costs of $1.76 million.

In our September 2004 report, we forecasted that the Fund would have a deficit, as of December 31, 2004, of $102.5 million. In this current report we estimate that the Fund had a deficit, as of December 31, 2004, of $117.6 million. The main reason for the increase in the estimated deficit is that the baseline estimate of future claim payments as of December 31, 2004 increased by $21.0 million from what was forecasted in our September 2004 report due to an increase in actual and projected nursing costs. Partially offsetting our higher forecasts, the total assets as of December 31, 2004 were $4.1 million higher than we had forecast.

Consistent with our past reports, we interpret the Program’s future payment obligations as of December 31, 2004 to consist of future claim payments associated with all claimants with birth dates on or before December 31, 2004, regardless of whether they have been admitted as of December 31, 2004. Therefore, we estimate the liabilities associated with the 97 admitted claimants (Table 1, column (2)), as of December 31, 2004, as well as those associated with what we estimate to be 47 not-yet-admitted claimants (Table 1, column (2)) as of December 31, 2004. Not-yet-admitted claimants as of December 31, 2004 are those claimants with birth dates on or before December 31, 2004 who had not yet been admitted to the Program as of December 31, 2004, but whom we estimate will eventually be admitted to the Program.
Major Findings

Following are our major findings.

1. **Finding:** We find that, as of December 31, 2004, the Fund was not actuarially sound and had a “Grand Total” deficit of about $117.6 million. By this we mean that the present value of estimated future claim payments for children born on or prior to December 31, 2004, plus the present value of estimated future claim administration expenses associated with making those claim payments, exceeded the Fund’s assets by about $117.6 million. (The present value represents the amount of assets that would need to be invested as of December 31, 2004, to pay the claimant expenses as they become due in the future.) We have used the same definition of actuarial soundness in each of our reports since 1992: if the estimated future payment obligations exceed the Fund’s assets, the Fund is deemed to be actuarially unsound.

As explained in the fourth Finding, which follows later in this section of the report, the Fund is not in any immediate danger of defaulting on the payment of benefits. In other words, although the Fund is not actuarially sound, it has sufficient assets to continue to pay for claimants’ benefits for approximately 18 years. This time span has decreased from the 20 years cited in our September 2004 report due to an increase in the forecasted lifetime costs per claimant, most of which is attributable to nursing expenses. The decrease in the time span due to higher claimant expenses is partially offset by legislated increases to assessment income from physicians and hospitals beginning with the 2005 program year and higher than expected forecasted assessment income from insurance companies beginning with the 2005 program year.

Our estimate of the Fund’s financial position as of December 31, 2004, is shown in Table 1, which follows.

The following discussion of Table 1 results focuses on the “Grand Total” line. In our discussion of our projections in Tables 1 through Table 4, all references to admitted claimants exclude those who we project will receive the one-time $100,000 award, unless we specifically discuss this subset of potential claimants.

Table 1 shows that, as of December 31, 2004, we estimate the Program had obligations for future claim payments (“Grand Total” of $240.0 million on a present value basis) and for future claim administration expenses (“Grand Total” of $8.0 million on a present value basis) that exceeded the Program’s assets (“Grand Total” of $130.4 million) by approximately $117.6 million.

Column 2 of Table 1 shows that, as of December 31, 2004, we estimate the Program had a “Grand Total” of 144 claimants. These 144 claimants consist of 97 claimants who had been admitted to the Program as of December 31, 2004 and an estimated additional 47 claimants born on or before December 31, 2004 who had not yet been admitted to the Program as of December 31, 2004 (no claimants eligible for the $100,000 award were reported during 2004). Most claimants do not apply to the Program, and are not admitted to the Program, until two or more years after their birth. The average age that the admitted claimants had attained when they were
admitted to the Program was 4.2 years, approximately the same as last year. Thirty of the 97 admitted claimants were admitted to the Program after they had attained the age of 5.

Column 3 of Table 1 shows our baseline estimate of the present value of future claim payments for the estimated admitted and not-yet-admitted claimants born on or before December 31, 2004. This is our baseline estimate, meaning that it is our “intermediate” estimate, consistent with the way we have measured the actuarial soundness of the Fund in our past reports. The baseline estimate lies within a range of possible outcomes; in other words, the present value of future claim payments could turn out to be significantly higher or lower than our estimate. This is discussed in more detail in the Sensitivity Testing section of this report.

Our estimates of future claim payments are on a present value basis, as of December 31, 2004. Presenting our estimates of future claim payments on a present value basis is consistent with our prior reports. The present value represents the amount that would need to be invested as of December 31, 2004 to make the claim payments as they become due. Throughout this report, discussions of future claim payments are on a present value basis unless otherwise indicated.

Column 4 of Table 1 shows our estimate of future administration expenses that are associated with the payment of the claims for the 144 claimants (admitted and not-yet-admitted) as of December 31, 2004 (see page 49 for a description of these expenses).

Column 5 of Table 1 shows our estimate of the value of the Fund’s total assets as of December 31, 2004.

Column 6 of Table 1 shows that our estimate of the Fund’s “Grand Total” assets as of December 31, 2004 is $117.6 million less than the sum of our estimates of the Program’s future claim payments and future claim administration expenses.

In summary, we estimate that, as of December 31, 2004, the Fund was not actuarially sound and had a “Grand Total” deficit of about $117.6 million. Our estimate of the present value of future claim payments for children born on or prior to December 31, 2004, plus our estimate of the
present value of future claim administration expenses, exceeds the Fund’s assets by about $117.6 million.

In our September 2004 report, we included a “Grand Total” forecast of the financial results as of December 31, 2004. A comparison of that “Grand Total” estimate to our current “Grand Total” estimate as of December 31, 2004 is given below:

- **Number of Claimants:** In our September 2004 report, we forecasted that there would be 144 claimants as of December 31, 2004, of whom 98 would be admitted and 46 would be not-yet-admitted. Our current estimate is that there were 144 claimants as of December 31, 2004, of whom 97 are admitted and 47 are not yet admitted.

- **Baseline Estimate of Future Claim Payments:** In our September 2004 report, we forecasted that there would be $219.0 million of future claim payments associated with the 144 claimants as of December 31, 2004. Our current estimate is that there were $240.0 million of future claim payments associated with the 144 claimants as of December 31, 2004. This is due mainly to the increase in average values underlying the future cost estimates as discussed on pages 3 and 4.

- **Estimate of Future Claim Administration Expenses:** In our September 2004 report, we forecasted that there would be $9.8 million of future claim administration expense payments associated with the 144 claimants as of December 31, 2004. Our current estimate is that there will be $8.0 million of future claim administration payments associated with the 144 claimants as of December 31, 2004 (see page 53 for a discussion of estimated claim administration expenses).

- **Value of Total Assets:** In our September 2004 report, we forecasted that the Fund would have assets of $126.3 million as of December 31, 2004. The actual value of assets as of December 31, 2004, as reported by the Fund, based on unaudited financial statements, was $130.4 million.
- Forecasted Surplus/(Deficit): In our September 2004 report, we forecasted that the Fund would have a “Grand Total” deficit of $102.5 million as of December 31, 2004. Our current estimate is that the Fund had a “Grand Total” deficit of $117.6 million as of December 31, 2004.

2. **Finding:** We forecast that the Fund will not be actuarially sound as of December 31, 2005, and will have a “Grand Total” deficit of about $125.4 million. This is shown in Table 2, which follows.

The estimated number of claimants that will have been admitted to the Program as of December 31, 2005, equal to 108, represents the 97 claimants who were admitted prior to December 31, 2004, as indicated in Table 1, plus an additional 11 claimants whom we estimate will be admitted to the Program during 2005. The rationale for our forecast of these 11 additional claimants is provided in the section of this report titled “Impact of Legislative Changes on the Number of Claimants” (page 58). Our forecast of these additional 11 claimants is consistent with the recent numbers of admissions (12 in 2003, 10 in 2004).

We estimate that three claimants will be admitted in 2005 solely to receive the award of up to $100,000. Columns 3 and 4 of Table 2 show $0 future payments for these claimants because it is assumed they will receive this one-time award immediately when they are admitted. The costs will reduce the assets, but they do not result in any future liability.

3. **Finding:** Including the estimated additional assessment income resulting from the July 1, 2004 legislation we forecast that the Fund will remain in a deficit position and that the “Grand Total” deficit will grow to $131.8 million at the end of 2006, and to $137.1 million at the end of 2007. This demonstrates that the legislated increases to assessments will not be sufficient to restore the Fund to an actuarially sound basis. This is shown in Tables 3 and 4, which follow.

Mercer Oliver Wyman Actuarial Consulting, Inc. 10
State Corporation Commission Bureau of Insurance
Referring to Table 3, Column 2, we estimate that the total number of claimants as of December 31, 2006 will be 164. This is an increase of ten claimants from the total number of claimants that we estimate there will be as of December 31, 2005, and reflects our forecast that each year ten children will be born who will eventually be admitted to the Program. Although the total number of claimants is the most important, we have also shown that our estimate of claimants consists of 117 claimants who we estimate will have been admitted into the Program as of December 31, 2006 and 47 claimants born on or before December 31, 2006 who will not yet have been admitted into the Program as of December 31, 2006.

The number of claimants admitted to the Program as of December 31, 2006, shown as 117 in Column 2, consists of the 108 claimants we estimate will have been admitted to the Program as of December 31, 2005 (See Table 2), plus an additional nine claimants who we forecast will be admitted to the Program during 2006. The number of claimants not yet admitted to the Program as of December 31, 2006, shown as 47 in Column 2, is the difference between the estimated total number of claimants (164) and the estimated number of admitted claimants (117).

We estimate that three claimants will be admitted in 2006 solely to receive the award of up to $100,000. Columns 3 and 4 of Table 3 show $0 future payments for these claimants because it is assumed they will receive this one-time award immediately when they are admitted. The costs will reduce the assets, but they do not result in any future liability.

</table>

Table 4 is similar to Table 3, except that it shows our forecast of the Fund’s financial position as of December 31, 2007.

Referring to Table 4, Column 2, we estimate that the total number of claimants as of December 31, 2007 will be 174, an increase of ten over the prior year, representing the children that we forecast will be born in 2007 and eventually admitted into the Program.

The number of claimants admitted to the Program as of December 31, 2007, shown as 126 in Column 2 of Table 4, consists of the 117 claimants we estimate will have been admitted to the Program as of December 31, 2006 (See Table 3) plus an additional 9 claimants that we forecast will be admitted to the Program during 2007. The estimated number of claimants not yet admitted to the Program as of December 31, 2007, shown as 48 in Column 2, is the difference between the estimated total number of claimants (174) and the estimated number of admitted claimants (126).

We estimate that three claimants will be admitted in 2007 solely to receive the award of up to $100,000. Columns 3 and 4 of Table 2 show $0 future payments for these claimants because it is assumed they will receive this one-time award immediately when they are admitted. The costs will reduce the assets, but they do not result in any future liability.
4. **Finding**: The Fund is not in any immediate danger of defaulting on the payment of benefits. In other words, although the Fund is not actuarially sound, it has sufficient assets to continue to pay for claimants’ benefits for approximately 18 years.

The Fund’s current assets are relatively large compared to current and expected future annual claim payments in the near term. The Program paid $6.0 million to claimants during 2004. The 6.0 million in actual payments made for the full year of 2004 was higher than both the $5.4 million in actual payments made for the full year of 2003 and the $4.6 million in actual payments made for the full year of 2002. During the first six months of 2005, the Program paid $3.19 million to claimants.

We forecast that the current assets of the Fund are sufficient to cover the claim payments of admitted (as of December 31, 2004) claimants for many years, given the historical payments of approximately $5 million to $6 million per year actually paid by the Fund. Specifically, we forecast that, if the Fund collects the assessments currently required in accordance with the July 1, 2004 legislation and, if the level of participation of physicians and hospitals remains constant at the 2005 levels, the Fund will be able to continue to make claim payments for all claimants, including those admitted after December 31, 2004 (even if those claimants are born after December 31, 2004), for approximately the next 18 years (that is, through the year 2022).
Recommendations

Following are our major recommendations.

1. **Recommendation**: We recommend that the Program continue to assess participating and non-participating physicians and participating hospitals at the increased levels as specified in the July 1, 2004 legislation (discussed in the Methodology - July 1, 2004 legislation section of this report).

2. **Recommendation**: We recommend that the Program continue to assess liability insurers at the maximum amount of one-fourth of one percent of net direct liability premiums written in Virginia.

3. **Recommendation**: Recommendations 1 and 2 notwithstanding, we recommend that the Program find means to increase funding, either through assessments or through the identification of other sources, to reduce the estimated deficit of the Program as it is currently structured.

4. **Recommendation**: We recommend that reviews of the actuarial soundness of the Fund be conducted annually.

5. **Recommendation**: We recommend that the Program continue to maintain and continually update claimant payment and personal information and assessment information in the format and level of detail as requested for each annual actuarial study.

6. **Recommendation**: We recommend that the Program continue to obtain copies of the claimants’ insurance policies and provide copies of the policies at the time of each actuarial review.
7. **Recommendation**: We continue to reiterate our recommendation that the Program obtain more detailed studies of the medical condition of each individual claimant who is admitted to the Program, and update this information when there are significant changes in a claimant’s medical condition.
Method and Assumptions

Introduction

In very general terms, we estimate the future payment obligations of the Program as follows:

- We estimate the total number of claimants. This consists of the actual number of admitted claimants, plus our estimate of the number of not-yet-admitted claimants.

- We forecast, by category of claim payment and for each of the claimants we estimate will be admitted to the Program, the future payments that will be made by the Program. These estimates are based on:
  
  - the actual payments made by the Program on behalf of the 68 claimants who had been in the Program for three or more years as of December 31, 2004 (in a limited number of cases, where it is known that the expense history will be distorted because a claimant switched insurances to or from Medicaid, we have adjusted our forecasts based on discussions with management of the Program);
  - our understanding of each of the 68 claimants’ insurance coverage and eligibility for Medicaid;
  - assumptions regarding future cost inflation;
  - assumptions regarding future increases in the utilization of the benefits and services of the Program.

- We adjust our projected future payments to each claimant to reflect:
  
  - an assumed life expectancy for each claimant (based on a life expectancy, or mortality, table); and,
  - the time value of money (based on estimated investment income).
This section of the report is organized into the following subsections:

- **Claim Payments**: This provides an overview of the types and amounts of payments that are covered by the Program, an explanation of how we forecast the future payments to individual claimants, and the values that we estimate as the total lifetime costs per claimant for the various payment categories.

- **Other Assumptions**: This provides discussion of the other assumptions (other than claim payments), such as inflation rates, the interest rate used to reflect the time value of money, insurance coverages, the number of not-yet-admitted claimants, and so forth.

- **Methodology**: This provides more precise discussion of how we combine our forecasts of payments with the other assumptions. This section also provides information on the effects of the July 1, 2003 and July 1, 2004 legislation.

- **Sensitivity Testing**: This discusses the sensitivity of our findings to various assumptions underlying our analysis.
Claim Payments

Table 5, below, shows a brief history of the actual claim payments, by year, from 1988 through 2004.

The increase in claim payments during 2004 as compared to 2003 ($6.0 million in 2004 compared to $5.4 million in 2003) is due mainly to the increase in payments for nursing services. During 2004, $4.4 million was paid by the Fund for nursing, compared to $3.0 million in 2003.

In this study, as in prior studies, our basic approach is to base our forecast of future claim payments on a detailed review of past payments in each category, by claimant, for all claimants in Group A (claimants in the Program for at least three years as of December 31, 2004).
September 2005

Method and Assumptions

Claim Payments

In addition to reviewing the actual claim payment histories of the individual claimants, we also discussed these histories with management of the Program. This provided valuable information regarding whether or not the claimant had insurance coverage or received Medicaid, and about some of the actual expenses that individual claimants were incurring. We understand through discussions with management of the Program that, currently, all claimants but one have either Medicaid or private insurance coverage, though claimants do occasionally switch insurance coverages, which may leave a claimant uninsured for a short period of time.

The Program currently keeps track of its claim payments in 12 categories (one of which, lost wages, has not yet been necessary because none of the claimants has yet attained the age of 18, when such payments begin). The Program provided the actual payments through December 31, 2004, sorted by category of payment by year and for each of the 97 claimants who were in the Program as of December 31, 2004. We use this information as the primary base for projecting the future costs of the Program. Table 6, which follows, provides a summary of this payment information, showing the total amount that the Program has paid, by category.

</table>
Claimants submit to the Program any costs not covered by private insurance or Medicaid, and the Program is responsible for paying these costs. The actual payments recorded by the Program represent "net" payments after recoveries from private insurance and Medicaid. There are several types of costs (for example, expenses for hospital stays or physician visits) for which the Fund has not made any payments for Medicaid patients. In cases where claimants have lost Medicaid benefits and now have private insurance, we use either the minimum values applied to all claimants, for those costs that were previously covered in full by Medicaid, or amounts based on conversations with management of the Program, in order to forecast the costs that are expected to be paid by the Fund in the future. These minimum values are discussed in detail, by category of payment, in the Methodology section of this report.

We base this current study, primarily, on actual payments through December 31, 2004, which represents a twelve-month update of the payments that were primarily used in our September 2004 study.

For analytical purposes we split the claimant population into three groups:

- Group A consists of all claimants who were admitted to the Program on or before December 31, 2001. That is, Group A claimants are those who have been in the Program at least three full years. Group A contains 68 claimants, including 11 deceased claimants.

We forecast the future costs of individual claimants in Group A based on the payments that have been made to this group of claimants. For each claimant in Group A, we have a minimum of three years of actual claim payments as of December 31, 2004. We would prefer, for forecasting purposes, to have many more years of actual claim payments in order to forecast, with a higher degree of confidence, lifetime costs of claimants. However, because the Program is relatively new, more extensive claim payment information does not exist.

Due to substantial variations in annual expenses across categories among Group A claimants, we use certain assumptions for each Group A claimant in our forecasting methodology. Our objective in this approach is to evaluate the Group A claimant expenses that will be appropriate on an aggregate basis, rather than on a claimant-by-claimant basis.
- Group B consists of all claimants who were admitted to the Program in 2002, 2003, or 2004. Group B contains 29 claimants, 4 of whom were deceased as of December 31, 2004.

In our opinion, the actual claim payment information for Group B claimants is not sufficiently credible to be used for forecasting their future claim payments. Each of the Group B claimants has less than three years of actual claim experience as of December 31, 2004. During a claimant’s first year in the Program, claim payments may be distorted due to payments made for costs incurred prior to admission into the Program. More importantly, for many claimants costs fluctuate significantly during the first few years of participation in the Program. Therefore, because of the limitations of the claim payment information for Group B claimants, we use the claim payment information for Group A claimants to forecast the future claim payments for Group B.

- Group C represents our estimate of the children born on or before December 31, 2004 who were not admitted to the Program as of December 31, 2004, but who will eventually apply to, and be admitted into, the Program. We estimate that Group C contains 47 future claimants (including those claimants eligible for the $100,000 award). We generally use information from claimants in Group A to forecast future claim payments for claimants in Group C. In addition, for the medical review/intake expense category, for which all costs are incurred during the claimant’s application process, we use information from Group B claimants to forecast future claim payments for claimants in Group C, in order to use the most recent information on this cost.

In the course of this project, we reviewed the cost history of each claimant and discussed the cost history with management of the Program, as we did in our last three studies. This discussion provided valuable information that has been helpful in preparing our forecasts.

Table 6 shows aggregate claim payments, by category, through December 31, 2004. By definition, because Groups A and B are the claimants who had been admitted to the Program by December 31, 2004, Table 6 shows the actual costs for all Group A and B claimants, combined.
Table 7, below, shows the projected average lifetime costs, by category, that we estimate for a Group C claimant. These estimates reflect our assumptions about the average life expectancy of these claimants, and all of the lifetime costs are shown at their present value, as of December 31, 2004. These estimates are based on our analysis of the payments made on behalf of the Group A (and to some extent Group B) claimants. Except for housing expenses, for which the Program’s policies have changed in recent years (as explained later in this section), and payment timing differences, the estimates in Table 7 are typical of the estimated lifetime costs for claimants in Groups A and B, as well.

The changes shown in Column (3), “Change from Prior Report,” reflect the year to year volatility in the actual expense, especially for Hospital/Physician and Prescription Drugs expenses. For Lost Wages, the reduction results from a change in methodology, as discussed previously in this report in the “Discussion” sub-section of “Major Findings and Recommendations.”

</table>

Note: Last year’s amounts are not adjusted for inflation. Adjusted for inflation, the change from the prior report would be $122,025.
Table 7 shows that we estimate the average amount of future claim payments, for a Group C claimant, on a present value basis, to be about $2.0 million (on a present value basis, about $100,000 per year adjusted for inflation, for 20 years). The nursing category represents about $1.4 million, roughly 72 percent, of this total, compared to 65 percent of this total in our September 2004 report. Although many claimants have had little or no nursing costs, a few have had large nursing costs. This is clearly the largest payments category, and any changes affecting the future cost or utilization of nursing services could have a major impact on our findings.

Following is a discussion of each individual cost category.
Nursing

Nursing covers the cost of in-home nursing care, and represents the most significant payment category for the Program. As shown in Table 6, approximately 51 percent of all payments made by the Program from inception to date have been for nursing. In 2004, nursing care costs increased by approximately 47 percent, from $3.0 million to $4.4 million, with a small percentage of this increase due to the admission of ten new claimants during the year.

Based on our discussions with management of the Program, we understand that a substantial portion of the increase in nursing expenses was due to the fact that the nursing community was able to meet a demand for additional nursing services that had not previously been met. We assume that the higher level of nursing services utilized by claimants in 2004 represents a one-time shift to a higher level of nursing services, and is not indicative of an underlying upward trend in annual claimant nursing expenses that will continue.

Supporting our assumption that the increase in nursing costs does not appear to be a trend, analysis of the claimant data shows that nursing costs, when adjusted for inflation, do not increase as the claimants age. Rather, our analysis suggests that nursing costs, when adjusted for inflation, are relatively flat. Of course, our data is limited to claimants who are no more than 16 years of age. We do not know how their nursing costs will change beyond age 16.

Our finding that nursing costs are not increasing by age represents a change from our October 2001 report. In that report, we stated that “Not only are nursing expenses high relative to other expense categories, but for many of the claimants they tend to be low for the first two or three years in the Program and then escalate significantly.” That statement, which was correct based on the claimant information available at the time of our October 2001 report, was not an analysis “by age,” but by years in the Program. At that time, there were a number of claimants whose nursing costs had been low when they first entered the Program, and then increased significantly. We have now accumulated significantly more claimant expense information, and have evaluated this data “by age,” and there does not appear to be an upward trend in nursing expense by claimant age. In reviewing the average cost of nursing by age of claimant, with historical costs...
adjusted to current cost levels, the average cost appears relatively constant from birth through age 16.

In 2004, the Program paid an average of about $53,400 per living claimant for nursing costs, which represents a 33.5 percent increase over last year’s comparable average. Included in this average are newly admitted claimants, many of whom had relatively little nursing costs in 2004. The average nursing payment made by the Program in 2004 to each living Group A claimant (those who have been in the Program for at least three years) was $63,000, which represents an approximate 20 percent increase over last year’s comparable figure.

The Program’s experience also reveals considerable variation in the amount of nursing costs paid to each claimant. Many claimants in the Program have low or no nursing costs, whereas others are receiving round-the-clock nursing at an annual cost in excess of $200,000. For those claimants receiving nursing services, most of the claimants receive services from licensed practical nurses (LPNs) and other claimants, because of their medical needs, receive services from registered nurses (RNs).

For each of the claimants in Group A, we generally base our future cost projections on the actual payments made to Group A claimants in 2004. Some Group A claimants have had very little costs in the nursing category, and for them we forecast future nursing costs to be $31,010 per year, at 2004 price levels (this is the equivalent of $25,000 per year at 2000 cost levels, consistent with the assumption used in our prior report). We use this minimum because we expect that, among those Group A claimants who currently have little or no nursing costs, some percentage will eventually incur nursing costs. We use the actual and forecasted claims experience of Group A claimants to forecast the future claims experience of claimants in Groups B and C and, therefore, this assumed annual minimum also affects our estimates of the forecasted claims experience of claimants in Groups B and C.

Thus far, only three claimants have been institutionalized, one of whom is deceased. Based on this experience, and on discussions with the management of the Program, it appears that families are keeping the claimants at home, with associated nursing care, much longer than had previously been
expected. Our current estimates reflect this actual experience and do not assume that claimants will be moved into institutional care.

We assume that the individual and group insurance coverage that claimants have does not provide coverage for nursing costs. This is based on our general knowledge that private health insurance typically excludes coverage for custodial nursing care. Further, this general knowledge is supported by the fact that none of the claimants’ insurance coverage pays for nursing costs, according to management of the Program.

Further, we assume that Medicaid does not provide coverage for nursing costs. We understand that, theoretically, Medicaid may cover this cost in some cases. However, none of the claimants in the Program has ever qualified for such payments from Medicaid, and our forecast assumes that none will in the future. Any future discussion between Medicaid administrators and the Program management that leads to the provision of Medicaid benefits for nursing care for some claimants would result in a reduction to our forecast of lifetime nursing costs, all other things being equal.

**Hospital/Physician**

The hospital/physician payment category includes costs incurred for surgery, hospitalization, trips to an emergency room, physical examinations, and so forth.

For each of the claimants in Group A, we base our future cost projections for hospital/physician costs on an average of the actual payments made by the Program to the Group A claimants in the past three years. Some Group A claimants have had very little cost in this category, and for them we forecast $2,437 per year at 2004 cost levels (this is the equivalent of $2,000 per year at 2000 cost levels, consistent with the assumption used in our September 2004 report). We use this minimum because we expect that, among those Group A claimants who currently have little or no hospital/physician costs, some percentage will eventually incur such costs. We use the actual and forecasted claims experience of Group A claimants to forecast the future claims experience of claimants in Groups B and C and, therefore, this assumed annual minimum also affects our estimates of the forecasted claims experience of claimants in Groups B and C.
We assume that insurance will cover 80 percent of allowable costs in this category, and that 80 percent of allowable costs will translate into 75 percent of actual costs. Therefore, we assume that the Program pays 25 percent of these costs, for claimants who have private insurance. For claimants who receive Medicaid, and for whom the Program has incurred some costs in this payment category, we assume that Medicaid is covering 80 percent of their costs in this category. As discussed in the Sensitivity Testing section of this report, the percentage of costs that we select as being covered by insurance or Medicaid actually has little impact on the final estimates.

**Incidental**

The incidental payment category includes: non-durable medical supplies, over-the-counter drugs, feeding tubes, diapers, computers, computer equipment, and any other expense not fitting into any of the other payment categories.

The Program's definition of "incidental cost" has not been consistent over time because, when the Program establishes new categories, the types of costs that were previously categorized as incidental are shifted to these new categories. Therefore, for each of the claimants in Group A, we base our projections of future costs on the actual incidental expenses paid to the claimants in Group A in 2004, the most recent full year. We use the actual and forecasted claims experience of Group A claimants to forecast the future claims experience of claimants in Groups B and C.

We assume that neither private insurance nor Medicaid provides coverage for incidental costs and, therefore, that the Program pays 100 percent of these costs.

**Housing**

Housing costs can be split into four sub-categories:

*Trust homes* – Until September 24, 1999, the Program purchased homes and provided them to claimants for the lifetime of the claimant (claimant families are permitted to remain in the home for six months after the death of the claimant). Although the Program identifies these purchases as costs, they are actually assets of the Program and we treat them as such. There have been a
total of 23 trust homes, six of which have been sold following the death of the claimant. All of the trust homes have been used by claimants in Group A.

_Housing Grant_ – Beginning September 25, 1999, the Program began to make grants to claimants for the construction of houses. The size of the grant varies according to the construction costs in the area where the claimant will live, but it generally averages about $350,000. When the grant has been made, it is paid out over time to cover construction costs of the house and incidental, related costs, such as rental costs, while the house is under construction. The claimants own the homes that they purchase with the aid of housing grants, so these are not assets of the Program. Thirteen grants have been awarded, all to Group A claimants.

_Renovations_ – Beginning January 1, 2001, the Program discontinued the housing grant program and, in its place, pays the costs of renovating the claimant’s existing house (if the claimant’s family owns a home) to add a bedroom and a bathroom. Consistent with our September 2004 report we have used an average estimate of $120,030 at 2004 cost levels.

_Rentals_ - The July 1, 2003 legislation specified, in section 38.2 – 5016 item 2, “that the board of directors of the Virginia Birth-Related Neurological Injury Compensation Program shall develop and implement a policy to address the needs of infants who are eligible for benefits under the Program for handicapped-accessible housing. The board’s policy shall address appropriate housing benefits when the infant’s parents or legal guardians are homeowners and are non-homeowners.”

To conform to this legislation, management of the Program has established a rental benefit of $175,000 for the lifetime of the claimant. This benefit represents the difference between the claimant’s current rent and the rent due for an upgraded accommodation that includes those features necessary for handicapped accessibility. The claimant and the claimant’s family must have moved to such an accommodation before receiving the benefit. According to management of the Program, the $175,000 value was selected to be consistent with the current benefit for renovations as discussed above.
For all claimants (or the claimant’s family, in the case where a claimant is deceased) who are in a trust home, we assume that the Program will pay $20,000 every three years into a trust fund, which is established for the payment of real estate taxes, maintenance, insurance, and so forth. We base this estimate on discussions with the Trustee responsible for these homes, who explained that the Program has been paying about $20,000 every three years into trust accounts for these homes.

For all claimants who have been provided a housing grant, whether Group A or Group B, the total amount of the grant is known and we only estimate when it will be paid. The timing of the payment depends on the timing of the construction of the new home. We generally assume that the Program will pay any outstanding balances on the grants over the two-year period from 2004 through 2005. As of December 31, 2004, there are outstanding housing grants for 13 claimants, for a total outstanding value of approximately $700,000. Though the Program did not pay any money for housing grants in 2004, claimants who have not used up their full grant allocation may still request the Program to pay for either initial or additional home renovations. Accordingly, we have estimated that the entire unused and outstanding grant amount of $700,000 will be requested and paid out over the next two years.

For all Group A and Group B claimants who are living and who are not in a trust home and who have not been given a housing grant, as well as for all Group C claimants, we assume that future housing costs will be $120,030 (at 2004 cost levels) for renovations and rentals (except in those cases where the renovations have already been completed). For claimants in Groups A and B, we assume that this amount will be paid in 2004. For claimants in Group C, we assume that this amount will be paid, on average, in four years.

Neither private insurance nor Medicaid provides coverage for housing costs.
Vans

The Program purchases vans for every claimant who is restricted to a wheelchair, if the claimant requests a van. Virtually all claimants are restricted to wheelchairs. Of the 82 claimants living as of December 31, 2004, only four were ambulatory.

In the initial years of the Program's operation, the Program purchased a mini-van for the claimant's first van. Special equipment, such as lifts, was added and repaired by the Program as needed. The van would then be used until the claimant outgrew it, generally at about age seven, at which time the Program purchased a full-size van for the claimant. Between 1997 and 1998, the Program started purchasing full-size vans as the first vans, rather than mini-vans. Beginning in 2002, the claimant's family has the option of selecting a modified mini-van or a full-size van. According to management of the Program, both options are at similar costs to the Fund. Beginning in 2003, the claimant's family was given a cost allowance for a vehicle of their choosing. The allowance is approximately $5,000 larger for those families for which the claimant is older and taller. On an on-going basis, the Program covers any repairs to the special equipment on the van, but repair and maintenance of the van itself is the responsibility of the claimant. Vans purchased by the Program for claimants become the property of the claimants and are not assets of the Program.

Consistent with the amount included in our September 2004 report and based on discussion with management of the Program, we assume that the average price of a van, with necessary equipment and including a provision for future repair of the equipment, is $31,668 at 2004 cost levels (this is the equivalent of $30,000 per year at 2000 cost levels). Further, we assume that the Program will replace full size vans every eight years. This is the same assumption we used in our last study.

Neither private insurance nor Medicaid provides coverage for vans.

Lost Wages

For claimants age 18 or older, the Program will pay for lost wages.
No claimants have attained the age of 18, and so this benefit has not yet been paid. The amount to be paid to each claimant is fixed at 50 percent of the private average weekly non-agricultural wage in Virginia. Currently, the average weekly non-agricultural wage results in an annual amount of about $38,272, and we use 50 percent of this, $19,136 per year (at 2004 cost levels), for our forecast. For each claimant, we adjust the $19,136 for inflation to forecast the annual amount that will be paid at age 18 and beyond.

In this year’s study, we have revised our methodology for calculating the present value amount for lost wages per Group C claimant. In prior studies, we had estimated the Group C present value amount for lost wages based on the amounts for Group A and B claimants, which is consistent with how we had derived our Group C claimant present value expense projections for other expense categories. This year, we have revised our methodology to reflect our assumption that the average age of all Group C claimants as of 12/31/04 is less than the average age of both the Group A and B claimants, and as a result there will be a longer period of time before the Group C claimants reach age 18 and begin to receive these benefits. We estimate that the average age of all Group C claimants as of 12/31/04 is approximately 3.5 years old. Based on this assumption, and assumptions regarding interest rates, inflation and mortality, we project that the average present value of lost wages per Group C claimant is $86,130.

**Physical Therapy**

Most claimants receive physical therapy for several years.

According to our discussion with management of the Program during 2004, and consistent with our observations for older claimants, physical therapy expenses tend to decline over time.

We forecast that for most of the claimants: the costs for each of the next five years will equal the costs of the most recent year; the costs of each of the subsequent five years will be one-half of the costs of the most recent year; the costs thereafter will be $0. This is consistent with the methodology used in our September 2004 report.
September 2005

Method and Assumptions
Claim Payments

We use the actual and forecasted claims experience of Group A claimants to forecast the future claims experience of claimants in Groups B and C and, therefore, our assumptions regarding the physical therapy expenses of Group A claimants also affects our estimates of the forecasted claims experience of claimants in Groups B and C.

We assume that private insurance and Medicaid provide coverage for physical therapy, in the same way that they provide coverage for hospital/physician expenses, as discussed above.

Medical Equipment

The medical equipment payment category includes costs associated with durable medical supplies. The most expensive component is wheelchairs. The Program provides children with their first wheelchair at about the age of three and provides replacement wheelchairs as the children grow.

For each of the claimants in Group A, we base our projections of future medical equipment costs on the actual payments made in the most recent three years. We use the actual and forecasted claims experience of Group A claimants to forecast the future claims experience of claimants in Groups B and C.

We assume that private insurance and Medicaid provide coverage for this payment category, in the same way that they provide coverage for hospital/physician costs, as discussed above.

Prescription Drugs

The Program did not begin to use a separate category for prescription drugs until 2000. Prior to 2000, these costs were assigned to other categories. For Group A claimants we project future costs based on the actual payments to Group A claimants in the most recent year. We use the actual and forecasted claims experience of Group A claimants to forecast the future claims experience of claimants in Groups B and C.

We assume that private insurance will provide coverage for this payment category in the same way as discussed above for hospital/physician costs. Based on claims histories for claimants
who have Medicaid, however, we generally assume that Medicaid will cover 100 percent of costs in this category. We have been told by management of the Program that not all drugs are covered by Medicaid, and the Program’s records indicate that the Fund has made insignificant payments for prescription drugs for two Group A claimants who have Medicaid. We forecast that these payments will continue.

Legal

Legal costs are incurred, by both the Program and the claimants, during the application process.

We assume that claimants in Groups A and B will not have any additional legal costs. For Group C, we forecast legal costs equal to the average legal costs for Group A.

Neither private insurance nor Medicaid provides coverage for legal costs.

Insurance

The Program pays for automobile insurance for the vans, up to $500 per year; this is equal to the amount paid in our September 2004 report. In addition, there are several claimants for whom the Program pays the premiums for private health insurance. We understand that the Program encourages families to purchase health insurance if they are otherwise uninsured, and the Program will pay the premium if necessary.

For each of the claimants in Group A, we project future automobile insurance costs at $500 per year for each claimant who has, or is projected to have, a van. For the Group A claimants for whom the Program is paying for private health insurance, we forecast the future annual cost to be equal to the actual cost paid by the Program in 2004.

Neither private insurance nor Medicaid provides coverage for these costs.
Medical Review/Intake

The medical review/intake category of payment includes costs that are paid by the Program during the claimant’s application process.

The Program recently established this category of payment. However, as mentioned in our September 2004 report, we understand that the costs per claimant have generally increased in recent years as the admission process has become more involved. For example, three or four medical opinions are now generally required, rather than only one.

We forecast $0 of future costs in this category for Group A and Group B claimants. For Group C claimants, we estimate the future costs based on the actual average costs for Group B claimants.

Neither private insurance nor Medicaid provides coverage for these costs.
OTHER ASSUMPTIONS

Inflation

For each of the payment categories discussed above, we estimate the annual inflation rate that will apply to future annual costs. We base these inflation rates on consumer price indexes published by the Bureau of Labor Statistics, including the “Consumer Price Index; All Urban Consumers; All Items,” which we refer to as the “general inflation index.” Our assumptions are shown in Table 8.

</table>

For each specific consumer price index and for the general inflation, Table 8 shows the annual rate of inflation that we forecast and the incremental difference between this assumed inflation rate and the inflation rate we forecast for the general inflation. For example, as shown in Column 2, we forecast that the annual inflation rate for nursing costs will be 4.50 percent, and this amount exceeds our forecast of the General Inflation rate by 1.19 percentage points (4.50 – 3.31 = 1.19) as shown in Column 3.
In addition, the table identifies the specific cost index upon which we base our estimate.

As shown in Column 4 of Table 8, we have information on the general inflation from 1913, but we only have information on the other cost indexes for shorter periods, such as from 1991 or 1993. Therefore, we first compare each cost index to the general inflation index, for a comparable time period, in order to estimate the difference between the change in that cost index and the change in the general inflation index. We then estimate the long-term rate of general inflation based on data from 1913 through 2004, and estimate the long-term rate of change for the individual indexes based on the assumed difference between that index and the index for general inflation. For example, based on data from 1991 through 2004, we estimate that the increase in costs for nursing is equal to the increase in the general inflation rate, plus 1.19 percentage points. We estimate that the long-term rate of general inflation is 3.31 percent and, therefore, we estimate that the long-term increase in nursing costs will be 4.50 percent (1.19 + 3.31 = 4.50).

The rates of inflation that we select reflect only changes in the unit costs of goods and services and are not intended to include provision for changes in the utilization of the Program’s benefits and services. Our assumptions regarding changes in utilization are discussed later in this report.

**Interest Rate**

After forecasting the future costs, using the payment assumptions and inflation rates discussed above, we discount the future costs to a present value. This requires that we assume a specific interest rate for discounting purposes. We forecast an annual rate of return of 6.55 percent, which we use for discounting purposes.

In our September 2004 study we assumed a 6.43 percent rate of return. In that study, we based this interest rate assumption primarily on the expected rate of return on invested assets, as stated by Merrill Lynch, the Fund’s investment manager. Merrill Lynch expected that it will realize a rate of return that is at least 3 percentage points higher than the change in the overall cost of living.
This year, the Fund has adopted a revised Investment Policy Statement, dated March 1, 2005, in which the Fund indicates that its investment goal “targets a total annual return of 6.8 percent.” In forecasting a projected rate of return for the Fund’s assets, we selected a differential of 3.50 percentage points above our forecast of general inflation, resulting in a projected rate of return of 6.81 percent for the assets invested by Merrill Lynch. Based on our conversations with the Fund, we understand this forecasted rate of return to be consistent with the Fund’s investment strategy as outlined in its revised Investment Policy Statement.

Furthermore, we understand that Merrill Lynch earned approximately 6.1 percent on the invested assets during 2004, which is lower than the 9.9 percent that Merrill Lynch earned in 2003. While the rates of return during the past two years tend to support the reasonableness of our forecast of a 6.81 percent long-term rate of return for these assets, if the annual rates of return in future years are consistently lower than our 6.81 percent estimate, we may need to adjust our assumptions.

Consistent with our September 2004 report we do not inflate the value of the trust houses. This is according to Generally Accepted Accounting Procedures (GAAP) that specifies that the value of the trust house is the lesser of the cost of the house or the market value of the house. We have not been provided with the market value of the trust houses and, to the extent that the market value of the trust houses is greater than the cost, our estimates of the value of this asset will be conservative. However, given the magnitude of this class of asset relative to the total assets of the Fund, it is our opinion that the difference will not be material.

The value of the trust houses, $5,052,551, or the cost of the houses, is lower than the value used in our September 2004 report because two trust homes were sold during 2004.

**Mortality**

For this report, we revised the mortality (life expectancy) table that we used in our 2004 report. In the discussion that follows, we review four mortality tables:

- The 1999 Table, which is the table that we introduced at the time of our 1999 study.
The “Blended Table,” which we calculated as one step in our approach to a new 2004 table.

The 2004 Table, which is the table that we used in our 2004 study.

The 2005 Table, which is the table that we are using in our 2005 study.

1999 Table
At the time of our 1999 report, we revised the table that had been in use for previous reports. That prior table was based on the assumption that the mortality rate of claimants in the Program would be double the mortality rate of children with cystic fibrosis, and would be slightly more than double during the first year of life. That prior table had originally been based on the expectation that claimants in the Program would have a very short life expectancy.

At the time of our 1999 report, we observed that the actual number of claimant deaths was less than what we would have expected based on the mortality table previously used, and we revised the table for that report so that it was identical to the underlying cystic fibrosis mortality table.

This table has an underlying average life expectancy of 17.5 years from birth, and an average life expectancy of 19.5 years for a child that attains the age of three. (Because claimants generally neither apply to, nor are admitted by, the Program until after the age of three or four, it is useful to show the life expectancy for children that have reached the age of three in addition to the life expectancy at birth.)

Blended Table
The Blended Table represents a combination of the 1999 Table and the 1998 U.S. Life Table, which is a mortality table for the population at-large. The blended table was created based on the following assumptions:

- The 1999 table is appropriate for use through age 15.
September 2005

Method and Assumptions
Other Assumptions

- Beyond age 15, the mortality of the claimants will gradually approach the standard mortality, merging with the standard mortality at age 85.

The logic underlying the Blended Table is that the claimants will have relatively high mortality during the first 15 years of life. The longer the claimants live, however, the more their future mortality will mirror the mortality of the standard population.

We developed the Blended Table in 2001, based on information contained in “Life Expectancy of Adults with Cerebral Palsy” by Strauss, et al, which appeared in Developmental Medicine & Child Neurology, 1998. In this study, the authors make use of a large database covering the developmentally disabled in California. This study suggests that the mortality of a population with cerebral palsy, which is a non-progressive disease, will gradually approach the standard mortality as the population ages. Virtually all of the claimants in the Program have cerebral palsy. Therefore, there is reason to believe that the Blended Table may be appropriate.

This table has an underlying average life expectancy of 22.1 years, from birth, and an average life expectancy of 24.7 years for a child who has attained the age of three.

2004 Table

In 2001 we began to move toward the Blended Table:

- The 2001 Table was an 80/20 weighting of the 1999 Table and the Blended Table
- The 2002 Table was a 70/30 weighting of the 1999 Table and the Blended Table
- The 2003 Table was a 60/40 weighting of the 1999 Table and the Blended Table
- The 2004 Table was a 50/50 weighting of the 1999 Table and the Blended Table

The 2004 Table had an underlying average life expectancy of 19.2 years, from birth, and an average life expectancy of 21.5 years for a child who had attained the age of three.
2005 Table

In our studies of the past several years we have gradually, but consistently, adjusted our mortality tables to reflect an emerging lower mortality rate among claimants, moving from the 1999 Mortality Table (the cystic fibrosis table) towards the Blended Table by increasing the relative weighting of the Blended Table versus the 1999 Mortality Table. We have increased the relative weighting of the Blended Table from twenty percent in our 2001 study, to fifty percent in our 2004 study.

The actual effect of the mortality table modifications (by increasing the relative weighting of the Blended Table) in our previous three studies has only impacted the mortality for years 15 and older. Since the 1999 Mortality Table and the Blended Table have the same mortality rates for years 0 to 15, the mortality table changes that we have made in our past three studies have resulted in an identical mortality for these years.

However, in our 2005 study, we have revised the mortality table for all years, and not only for years 15 and older, which reflects a more significant modification to mortality than we have instituted in prior years. In this report, we have set mortality equal to 85 percent of the mortality in the Blended Table for ages 0 through 15, and equal to a 40/60 weighting of the 1999 Mortality Table and the Blended Table for ages greater than 15. The shift from a 50/50 weighting (reflected in our 2004 report) to a 40/60 weighting of these two mortality tables for years 15 and older is consistent with our approach in prior studies. The adjustment for ages 0 through 15 responds to the fact that the mortality of claimants in the Program has been lower than expected: 15 deaths through December 31, 2004 as compared to 19.1 deaths that would be predicted based on the Blended Table.

We have considered the fact that both the Census Bureau and Society of Actuaries frequently produce new mortality tables. In our opinion, for the purpose of estimating the liabilities of the Birth Injury Fund, it is not necessary for us to adopt these new tables as they become available. Instead, in our opinion, the appropriate approach is to (a) continue to ensure that the mortality table is reasonably consistent with the Program's actual experience at the younger ages (for which the Program has data), and (b) continue to use expected experience for the higher ages
(grading to published standard mortality, as suggested by the study by Strauss, et al, cited on page 38).

This table has an underlying average life expectancy of 21.2 years, from birth, and an average life expectancy of 23.4 years for a child who has attained the age of three.

**HMOs versus non-HMOs**

We are unable to obtain exact information on the coverage provided by the claimants’ underlying insurance because the Program does not maintain that information. However, we have been informed that all claimants are currently insured. For each claimant we determined whether they (a) have private insurance, or (b) receive Medicaid.

For those claimants who have private insurance, we cannot determine if they have group insurance or individual insurance, or if their insurance coverage is through an HMO or one of the various types of non-HMO programs. We assume that 17.3 percent of the insurance policies are HMOs, based on the average for all health insurance policies in Virginia as reported by Kaiser Family Foundation (http://www.statehealthfacts.kff.org/).

We assume that each type of insurance coverage provides coverage for 80 percent of allowable costs, which reduces to 75 percent of actual costs for hospital/physicians, physical therapy, medical equipment, and prescription drugs. These assumptions (80 percent of allowable costs, and 75 percent of actual costs) are based on general knowledge of the insurance industry.

Further, we assume that each non-HMO insurance policy provides a lifetime maximum benefit of $1 million, and that there is no lifetime limit on an HMO insurance policy.

**Number of Group C Claims**

The number of claimants in Group C, which represents our estimate of the number of claimants born on or before December 31, 2004 who were not yet admitted to the Program as of December 31, 2004, has a significant effect on our estimates of the total future claim payments. We
estimate that there are 47 Group C claimants as of December 31, 2004. Our estimate is based on a review of how long it takes for claimants to be admitted to the Program.

**Group C Average Values**

We estimate that Group C claimants have an average lifetime cost of $2.0 million (at 2004 cost levels).

For most of the payment items, we estimate the future lifetime cost of a Group C claimant based on the average expected lifetime costs for Group A claimants. The only exceptions are as follows:

- **Housing** – We estimate these costs to be $120,030 at 2004 cost levels.

- **Lost Wages** – We estimate these costs to be $19,136 per year at 2004 cost levels, beginning at age 18.

- **Medical Review/Intake** – We estimate these costs to be equal to the actual average costs of Group B claimants.

**Future Claim Administration Expenses**

As shown in Table 1, we estimate $8.0 million as the present value of future claim administration expenses, for costs associated with the estimated 144 claimants as of December 31, 2004.

- In general, claim administration expenses have decreased this year over those estimated last year. Last year, management of the Program estimated that the Program’s total annual administrative expenses would be approximately $750,000 of which approximately $600,000 (80 percent) would be for claims administration. This year, management of the Program estimates that the Program’s total annual administrative expenses will be approximately $650,000 of which approximately $520,000 (80 percent) will be claim-related.
Changes in Utilization
A significant factor that underlies the future payments that will be made by the Program is the degree to which the Program’s benefits and services will be utilized. Nursing is the major expense, and to a large degree the extent of nursing care is the choice of the claimant’s family. Significant increases in the utilization of nursing would significantly impact our estimates.

We provide in our estimate some degree of continued increases in the utilization of Program benefits and services. For example, we use an annual minimum, per claimant, of $31,010 for nursing costs and $2,437 for hospital/physician costs in 2004 dollars. In addition, we assume that future nursing costs paid by the Program will increase at a rate of one percent per year due to increases in utilization of services and benefits. This one percentage point rate of increase is in addition to the provision for cost inflation discussed earlier.

Assessment Income
In the “Methodology” section of this report, the subsection titled “Forecasts of Program’s Financial Position Through 2007” beginning on page 50 explains the process that we follow to forecast the financial position of the Program as of the end of 2005, 2006, and 2007. Our assumptions regarding the future assessment income are important elements of these forecasts. In the “Methodology – July 1, 2004 Legislation” section of this report we detail the assumptions regarding future assessment income.

The “Background” section of this report provides a narrative history of the assessments. Exhibit 3, in the Appendix, shows the history of the assessment income, by program year, from 1988 through 2005.

Participating Physicians and Hospitals
As shown on Exhibit 3, 2005 assessment income is about $2,385,000 from participating physicians (the equivalent of 467.65 physicians participating for the full 12 months, each paying $5,100) and
about $2,753,450 from participating hospitals (there are 35 participating hospitals, each paying $50 per live birth subject to a maximum of $160,000 per hospital).

For program year 2005, we selected the amounts of assessment income based on two factors, the amounts actually collected through June 30, 2005, and discussions with management of the Program. We recognize that actual 2005 assessment income may vary from our forecast, depending on how many new doctors and hospitals join the program during the last half of the year.

For program years 2006 and 2007, our baseline forecast is that the level of participation by physicians and hospitals will remain at the 2005 level. However, based upon the July 1, 2004 legislation, which became effective with the 2005 Program year, assessment income will increase. As discussed in the “Methodology – July 1, 2004 Legislation” section of this report, assessment income for participating physicians is expected to grow by $49,600 per year, through 2009 (that is, 496, the estimated number of participating physicians before pro-ration, times $100) and for hospitals, assessment income is expected to increase by $43,550 in 2006 and by $40,000 in 2007, due to the raising of the cap on assessments for each of these years.

**Non-Participating Physicians**

According to information supplied by the program as of June 30, 2005, we estimate that for program year 2005 the assessment income from non-participating physicians will be about $3,567,460 (approximately 13,721 doctors, each paying $260).

For program years 2006 and 2007, based upon the July 1, 2004 legislation, the assessment income from non-participating physicians is expected to increase by $137,210 per year (that is, by an amount equal to $10 per year for each of 13,721 non-participants).

**Liability Insurers**

For program year 2005, the State Corporation Commission, Bureau of Insurance Commonwealth of Virginia has estimated that the assessment income from liability insurers is about $12,003,068. This amount is equal to one-quarter of one percent of net direct liability premiums written in Virginia, the maximum permissible assessment.
For program year 2006, we forecast that the Program will continue to assess liability insurers at the rate of one-quarter of one percent of net direct liability premiums written in Virginia. Based upon the 2005 assessment value of $12,003,068 and the insurance inflation rate of 3.31 percent per year, we forecast that this future assessment will be equal to about $12,399,900 in 2006.

Similarly, for program year 2007, we estimate that the assessment income from liability insurers will be about $12,809,830.
Methodology

The two prior subsections – Claim Payments and Other Assumptions – provide a fairly complete description of how we estimate the future payments. The purpose of this subsection is to provide some additional details.

Number of Claimants

In this report we estimate the number of claimants based upon: the estimates made in our September 2004 report, the claims emergence during 2004, and consideration of the July 1, 2003 legislation.

In our September 2004 report we estimated that there would be a total of 98 admitted claimants as of December 31, 2004. As of December 31, 2004 there were a total of 97 admitted claimants. Of the 10 claimants who entered the program in 2004 (97 minus the 87 admitted claimants who were in the program as of December 31, 2003), we have assumed that 6 entered without consideration of the July 1, 2003 legislation (as projected in our September 2004 report) and 4 entered as a direct result of the legislation (rather than the 5 projected in our September 2004 report). This allocation of claimants entering the program is somewhat arbitrary because we have no means of determining which claimants entered the program due to the July 1, 2003 legislation.

Estimated Future Costs of Group A Claimants

The Program’s database of payment information is “net,” after the claimants have collected for any private insurance or Medicaid coverage that they may have. We assume that the non-HMO insurance contracts have lifetime maximum payments of $1,000,000. Therefore, in order to project the future costs, we need to estimate when the underlying insurance policy will reach the maximum cap of $1,000,000.
We do this as follows:

- For each claimant, we adjust the “net” losses to a “gross” basis.
  
  - For claimants with insurance, for the three expense categories covered by insurance, the gross losses are assumed to equal four times the net losses (in other words, we assume that insurance covers 75 percent of the total cost). For the expense categories that are not covered by insurance, we assume that the gross amount is equal to the net amount.
  
  - For claimants who receive Medicaid, we make the same adjustment as for claimants with insurance; however, we assume that 80 percent of the costs will be covered rather than 75 percent.
  
  - For claimants who do not have insurance and do not receive Medicaid, we assume all of the gross costs are equal to the net costs.

- We project the gross annual costs for each expense category, applying the selected inflation rates.

- We calculate when the insured portion of the gross costs will reach $1,000,000, for the non-HMO population of claimants, and assume that there will be no insurance coverage beyond this point.

- We convert the projected gross costs back to a net basis, based on the assumed amount of insurance coverage.

We then apply assumptions regarding life expectancy and the investment earnings rate to these projected net costs.

The series of calculations that involve converting the expenses to a gross basis, and then converting them back to a net basis, only affects the timing of when the assumed $1,000,000 insurance cap will be reached, and does not have a material impact on our estimates.
Estimated Future Costs of Group B Claimants

We generally use the estimated average lifetime costs of Group A claimants (claimants who were admitted to the Program in 2001 or prior) to estimate the lifetime costs of Group B claimants (claimants who were admitted to the Program in 2002, 2003, or 2004). This implies, among other things, that the Group B claimants will have the same distribution of insurance coverages as Group A claimants. Based on the information that we have about insurance coverages, this assumption appears to be appropriate.

For claimants that were Group A claimants as of 12/31/03, the payments made during 2004 were $4.4 million. In our September 2004 analysis we forecasted that these payments would be $5.1 million. In addition, we have observed that, in 2004, the actual claim payments for Group B claimants (which would include claimants Not Yet Admitted to the Program as of 12/31/03, but admitted during 2004), were $1.6 million as compared to the forecast of $3.8 million (of the $2.2 million difference, $1.2 million is caused by nursing). This discrepancy occurred last year, also, and was discussed in our September 2004 report. There are two possible explanations for this:

(1) It is possible that Group B claimants will actually have average lifetime costs that are significantly less than those of Group A claimants, rather than consistent with those of Group A claimants, as forecast.

We do not yet have sufficient claimant history to reach a definitive conclusion about whether the more recent claimants (Group B) will have lower lifetime costs than the claimants who have been in the Program for more than three years (Group A).

We note that if (1) occurred, our estimation process will tend to be “self-correcting” as the Group B claimants move into the Group A category.

(2) It is possible that Group B (and Group C) claimants will have average lifetime costs consistent with those forecast, but that we overestimated the percentage of lifetime costs that
would be paid in 2003. In other words, the issue could be related to the timing of the payments rather than to what the total amount of payments will ultimately be.

If (2) occurred, then the forecasted deficit would nevertheless have been appropriate, because an overstatement of the forecasted payments would have been offset by the understatement of the liabilities. In other words, as stated above, this issue would be a timing difference.

We do not yet have sufficient claimant history to reach a definitive conclusion on the timing of the payment of claimant expenses. We intend to examine these issues over time, and make adjustments to our assumptions as may be appropriate.

**General Administration Expenses (Other Than Claim Administration)**

For the purpose of forecasting the value of the Program’s assets through December 31, 2005, December 31, 2006, and December 31, 2007, we estimate the amount of the Program’s general administration expenses (other than claim administration expenses). General administration expenses include that portion of salaries, rents, costs of office equipment, and all other expenses not directly related to claims.

General administration expenses are not shown on Tables 1, 2, 3, or 4, because they do not represent a future obligation, or liability, of the Fund. However, in order to forecast the Fund’s assets through 2005, 2006, and 2007, we estimate the general administration expenses that will be paid each year and deduct these from the assets that the Fund would otherwise hold.

In total, we estimate that the annual cost of general administration will be $130,000 at current cost levels. We assume that the general administration expenses will increase over time due to inflation (see page 53 for a discussion of claim administration expenses).
Forecasts of Program’s Financial Position Through 2007

The method we use to forecast the Program’s financial position as of December 31, 2005, as of December 31, 2006, and as of December 31, 2007, is to estimate for each year:

- Assessment income
- Claim payments
- Claim administration payments
- Payments for other administration expenses
- Investment earnings

Then we calculate the assets to be equal to the assets as of the end of the prior year, plus estimated assessment income and estimated investment income, minus the estimated payments.

Then we calculate the obligations for future claim payments and future claim administration expenses, as equal to the obligations for such future payments as of the end of the prior year (increased by the interest rate to unwind the discount by one year), plus the future claim payments and claim administration expenses associated with the new claimants that will be born during the year, minus payments for claims and claim administration expenses.

The surplus/(deficit) is calculated as estimated assets minus our estimate of the Program’s future claim payments and future claim administration expenses.

Appendix Exhibit 5 provides an example of our calculations for December 31, 2006, showing how we calculated the values for future claim payments and assets.
In performing these calculations, we estimate the claim payments based on our long-term forecasts of claim payments by year. We recognize that, after having estimated the present value of lifetime claim payments, the procedure that we use to allocate these lifetime claim payments to each payment year may tend to overstate the amount of claim payments in the early years. However, the impact of this on our estimate of the surplus/(deficit) is not material.
Methodology – July 1, 2003 Legislation – Revisited

In our September 2004 report we presented a complete review of the anticipated increases to the costs of the Program resulting from the July 1, 2003 legislation. Based upon the July 1, 2004 legislation, review of the Program’s experience for 2004 and the first half of 2005, and discussions with the Program’s director, we have revised some of the assumptions made in our September 2004 report regarding the potential impact of the July 1, 2003 legislation on the costs of the Fund.

We have reflected these revised estimates in Tables 1 through 4 of the Discussion section of this report.

The revisions to the impacts of the legislative changes fall into four categories:

- administrative expenses;
- legal expenses;
- number of claimants;
- number of claimants eligible for the $100,000 award.

As was the case in our September 2004 report, our estimates of the impact of the legislative changes, as discussed below, are subject to significant uncertainty. These estimates will undoubtedly change again over the next several years, as we ascertain the actual administrative expenses of the Program under the new legislation, and review how many new claimants come into the program. However, there will be no way to determine which additional costs are actually attributable to the legislative changes.
Changes to Assumptions Regarding July 1, 2003 Legislative Changes

Administrative Expenses
In our September 2004 report we forecasted $120,000 in non-claimant administrative expenses for program year 2004. Our forecast was consistent with the actual value of non-claimant administrative expenses of approximately $130,000. This equates to roughly twenty percent of total administrative costs for program year 2005 of $650,000.

For program year 2005, the Fund estimates that it will again incur approximately $650,000 in administrative expenses, of which approximately twenty percent ($130,000) will be non-claimant related.

In our September 2004 report, in accordance with a provision contained in the July 1, 2003 legislation concerning all petitions to enter the Program that are made subsequent to July 1, 2003, we included projections to cover the legal costs of attorneys representing those potential claimants who are not, ultimately, accepted into the Program. The July 1, 2004 legislation removed this provision of the July 1, 2003 legislation. That is, for all petitions to enter the Program that are made subsequent to July 1, 2004, the Fund will not be required to pay for the legal expenses of attorneys who represent unsuccessful claimants.

In our September 2004 report, we projected $15,000 to be paid in 2005 for the legal expenses outlined above. As of July 1, 2005, no attorney fees for unsuccessful claimants have been paid by the Fund; however, we note that it can take several years to determine which claimants prove to be unsuccessful in their bid to enter the Fund.

Number of Claimants Eligible for the $100,000 Award
In our September 2004 report, we assumed that the number of claimants eligible for this award would be 40 percent of the claimants otherwise admitted to the Program. We lowered this estimate from 50 percent to 40 percent in last year’s analysis. This estimate was based on a review of claimant information for Florida’s program. The director of the Virginia Program has indicated that, as of July 1, 2005, no such award has been granted. Therefore, we have lowered the assumed percentage from 40 percent of the claimants otherwise admitted to the Program to
30 percent. Since only two years have elapsed since the July 1, 2003 legislation became effective, we do not believe it is prudent to lower the value below 30 percent at this time. However, we will continue to monitor the future payments, both in number and amount, under this provision of the July 1, 2003 legislation.
Methodology – July 1, 2004 Legislation – Revisited

The legislation that became effective on July 1, 2004, has two effects: (1) it removes a provision included in the July 1, 2003 legislation regarding attorney fees incurred in connection with the filing of a claim which is ultimately not accepted into the Program (this is discussed in the previous section of this report); (2) it results in an increase in assessment income beginning with the 2005 program year.

The following sections of the legislation are discussed in so far as each one affects the estimated assessment income of the Program. The discussion is limited to those sections that are expected to materially impact the Program’s income.

(In the following paragraphs, the material in italics is quoted directly from the new legislation; HB No.1407 and SB No. 687)

Section 38.2 - 5020. Assessments

A. A physician who otherwise qualifies as a participating physician pursuant to this chapter may become a participating physician in the Program for a particular calendar year by paying an annual participating physician assessment to the Program in the amount of $5,000 on or before December 1 of the previous year, in the manner required by the plan of operation. Effective January 1, 2005, the total annual assessment shall be $5,100 and shall increase by $100 each year thereafter, to a maximum of $5,500 per year.

Based upon the number of participating physicians as reported by the Program as of June 30, 2005, we estimate that this will result in additional assessment revenue to the Program of $49,600 (that is, 496, the estimated number of participating physicians before pro-ration, times $100) for each year from 2005 through 2009. The assessment revenue is estimated to remain constant from 2009 forward. Based upon the 2004 assessment income reported to us as collected by the Program for participating physicians ($2,335,409), we estimate that the assessment
income from participating physicians will equal about $2,385,000 for 2005, increasing by $49,600 per year until it reaches about $2,583,400 for program year 2009 and will remain at that level. We have included these values in line (c) of Tables 1 though 4 of the Major Findings section of this report.

C. A hospital that otherwise qualifies as a participating hospital pursuant to this chapter may become a participating hospital in the Program for a particular year by paying an annual participating hospital assessment to the Program, on or before December 1 of the previous year, amounting to $50 per live birth for the prior year, as reported to the Department of Health in the Annual Survey of Hospitals. The participating hospital assessment shall not exceed $150,000 for any participating hospital in any 12-month period until January 1, 2005. Effective January 1, 2005, the total annual assessment shall be $160,000, and shall increase by $10,000 each year thereafter, to a maximum of $200,000 in any 12-month period.

We have assumed that the above provision means that the maximum cap on assessment income increases by $10,000 each year beginning in 2005 and results in a maximum cap of $200,000 in 2009 and thereafter.

Based upon the participating hospitals in the Program as of June 30, 2005 (as supplied by management of the Program) and the number of live births for each of these hospitals for the year 2003 (as supplied by the State Corporation Commission Bureau of Insurance Commonwealth of Virginia*), we estimate that this will result in the following assessments for participating hospitals:

2005 program year: $2,753,450 (as supplied by the Program)
2006 program year: $2,797,000 (increase of $43,550 due to raising the cap to $170,000)
2007 program year: $2,837,000 (increase of $40,000 due to raising the cap to $180,000)
2008 program year: $2,866,250 (increase of $29,250 due to raising the cap to $190,000)
2009 program year: $2,876,250 (increase of $10,000 due to raising the cap to $200,000)
2010 and subsequent years: $2,876,250.

* Information from Virginia Health Information (VHI) 2003 public information data set.
We have included these values in line (c) of Tables 1 through 4 of the Major Findings section of this report.

D. All licensed physicians practicing in the Commonwealth on September 30 of a particular year, other than participating physicians, shall pay to the Program an annual assessment of $250 for the following year, in the manner required by the plan of operation until January 1, 2005. Effective January 1, 2005, the total annual assessment shall be $260, and shall increase by $10 each year thereafter to a maximum of $300 per year.

Based upon the number of non-participating physicians as reported by the Program as of June 30, 2005, we estimate that this will result in additional assessment revenue to the Program of $137,210 (that is, 13,721 times $10) for each year from 2005 through 2009. The assessment revenue is estimated to remain constant from 2009 forward. Based upon the 2004 assessment income reported to us as collected by the Program, for non-participating physicians ($3,429,100), we estimate that the assessment income from non-participating physicians will equal $3,567,500, for 2005, increasing by $137,210 per year until it reaches $4,116,300 for program year 2009 and will remain at that level. We have included these values in line (c) of Tables 1 through 4 of the Major Findings section of this report.
Impact of Legislative Changes on the Number of Claimants

- Prior to the July 1, 2003 legislation, in our September 2002 report, we forecasted that approximately seven claimants would be admitted to the Program each year (our actual forecast was for seven admissions in 2002, six in 2003, and seven in 2004.)

- In our September 2003 report, we observed that seven claimants had been admitted in 2002, and we forecasted that, in the absence of any legislative changes, seven would be admitted in 2003, six in 2004, and six in 2005.

Further, in our September 2003 report, we estimated that the number of claimants who enter the Program as a result of the July 1, 2003 legislation (and as a result of a judicial decision, the Coffey case) would be seven in 2003, six in 2004, six in 2005, and three per year thereafter. In addition, we expected that as of December 31, 2006 there would be 11 such claimants who had been born but were not yet admitted to the Program, resulting in a total of 33 claimants (22 admitted, 11 not admitted) as of December 31, 2006.

We noted in our September 2003 report that three provisions of the July 1, 2003 legislation, plus the Coffey case, might impact the number of future claimants admitted to the Program. The three provisions were: Section 38.2 -5004.1 (Notification of possible beneficiaries), which we thought was the most important; Section 38.2 – 5008 (Determination of claims; presumption; ...); and Section 38.2 – 5009, B, which allowed for the reimbursement of reasonable attorneys’ fees in the event an applicant is denied admission.

- In our September 2004 report, we observed that twelve claimants had been admitted in 2003, which we judgmentally allocated to seven who would have been admitted in the absence of the 2003 legislative changes (and the Coffey decision), and five who were admitted as a result of the 2003 legislative changes (and the Coffey decision).
We forecasted that, in the absence of any legislative changes (and the Coffey decision), six would be admitted in 2004, six in 2005, six in 2006.

We forecasted that as a result of the 2003 legislative changes (and the Coffey decision) five would be admitted in 2004, five in 2005, three in 2006, and three per year thereafter. In addition, we expected that as of December 31, 2006 there would be 12 such claimants who had been born but were not yet admitted to the Program, resulting in a total of 30 claimants (18 admitted, 12 not admitted) as of December 31, 2006. This represents a reduction of three, from 33 to 30, in our estimate of the numbers of claims resulting from the 2003 legislative changes (and the Coffey decision).

In our September 2004 report, we noted the repeal of Section 38.2 – 5009, B (cited above), as of July 1, 2004 (the July 1, 2004 legislation). This repeal eliminated the reimbursement of attorneys' fees incurred in connection with the filing of a claim which is ultimately not accepted into the Program. In our September 2004 report, we also noted that 12 claimants entered the Program during 2003, which was two less than our forecast of 14 claimants. In consideration of these factors, we reduced our estimates for the number of claimants who will enter the Program as a result of the July 1, 2003 legislation.

- In this current report, we observe that ten claimants entered the Program during 2004, which we judgmentally allocated to six who would have been admitted in the absence of the 2003 and 2004 legislative changes (and the Coffey decision), and four who were admitted as a result of the 2003 and 2004 legislative changes (and the Coffey decision). This number of new claimants, ten, was consistent with our projection of eleven in our September 2004 report (but it is not possible to determine how many actually resulted from the legislative changes). Accordingly, we are maintaining our forecast of the prior year:

  -- that in the absence of any legislative changes (and the Coffey decision), six would be admitted in 2005, six in 2006, and six in 2007;

  -- that five claimants will enter the Program in 2005 as a result of the legislative changes and the Coffey decision, and three per year in 2006 and thereafter.
We are expecting the total number annual admissions to stabilize by 2007, which will be incorporated in our 2008 report. We are expecting that the total number of annual admissions will stabilize at approximately ten per year, which represents approximately seven per year \textit{in the absence of the 2003 and 2004 legislative changes (and the Coffey decision)}, and three per year who are admitted \textit{as a result of the 2003 and 2004 legislative changes (and the Coffey decision)}. Our current estimates and forecasts may turn out to be too high, or too low, because of our interpretation of the impact of the legislative changes and the Coffey decision (among other factors).
Sensitivity Testing

Our forecasts of future claim payments are for the lifetime costs of the Program’s claimants. Although the average life expectancy of claimants is relatively short, many of the individual claimants are likely to live well into their adult years. Our forecasts, in fact, include provision for the remote chance that an individual claimant lives to age 99. Given the long-term nature of the forecast, the forecasted future claim payments are highly sensitive to slight changes in certain assumptions, such as inflation, interest rates, and mortality. In this section of the report, we show how our estimate of the present value of future claim payments as of December 31, 2004, changes as we vary our assumptions.

In addition, many of the basic assumptions, such as forecasted nursing costs, are subject to a high degree of uncertainty. We provide for some increase beyond the current level of benefit and service utilization, but changes in the level of utilization could be higher or lower than what we assume. It is important, therefore, to consider the potential for the Program’s actual payments to differ from our forecasts.

The remainder of this section presents results of sensitivity testing, as well as further discussion of the claim payment categories.
Inflation

Table 9 shows the sensitivity of our estimates, as of December 31, 2004, to various inflation rates:

<table>
<thead>
<tr>
<th>Annual Inflation Rates (Baseline +/-)</th>
<th>Estimated Future Claim Payments ($ in millions, on a present value basis)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1.50%</td>
<td>$205.5</td>
</tr>
<tr>
<td>-1.00%</td>
<td>215.7</td>
</tr>
<tr>
<td>-0.50%</td>
<td>227.1</td>
</tr>
<tr>
<td>Baseline</td>
<td>240.0</td>
</tr>
<tr>
<td>+0.50%</td>
<td>254.6</td>
</tr>
<tr>
<td>+1.00%</td>
<td>271.3</td>
</tr>
<tr>
<td>+1.50%</td>
<td>290.5</td>
</tr>
</tbody>
</table>

The baseline inflation rates vary by expense category, as shown in Table 8.

Table 9, Column 2 shows that our baseline estimate of future claim payments is $240.0 million, corresponding to the amount shown in Table 1. Column 1 lists various departures from our baseline assumptions regarding annual inflation rates, and Column 2 shows how our estimate of the Program’s total future payments changes given the indicated departure from the baseline assumptions. For example, the first row shows that if we select annual inflation rates that are 1.50 percentage points less than our baseline estimates, the estimated present value of future claim payments will be $205.5 million, rather than the $240.0 million that results from our baseline estimates. As another example, the last row shows that increasing the inflation assumptions by 1.50 percentage points will increase the estimated present value of future claim payments to $290.5 million.
The higher the annual rates of inflation, the greater the estimated present value of future claim payments. This results directly from the fact that we are forecasting claim payments into the future and, therefore, the forecasted claim payments are higher if we assume higher inflation rates.

This sensitivity test only changes the inflation rates. In our actual analysis, inflation rates and the interest rate are related.

**Interest Rate**

Table 10 shows the sensitivity of our estimates, as of December 31, 2004, to various interest rates used for discounting:

<table>
<thead>
<tr>
<th>Interest Rate (Baseline +/-)</th>
<th>Estimated Future Claim Payments ($ in millions, on a present value basis)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1.50%</td>
<td>$284.5</td>
</tr>
<tr>
<td>-1.00%</td>
<td>267.3</td>
</tr>
<tr>
<td>-0.50%</td>
<td>252.6</td>
</tr>
<tr>
<td>Baseline</td>
<td>240.0</td>
</tr>
<tr>
<td>+0.5%</td>
<td>229.0</td>
</tr>
<tr>
<td>+1.00%</td>
<td>219.5</td>
</tr>
<tr>
<td>+1.50%</td>
<td>211.2</td>
</tr>
</tbody>
</table>

Table 10, Column 2 shows that our baseline estimate of future claim payments is $240.0 million, corresponding to the amount shown in Table 1. If we had used an annual interest rate that was, for example, 1.00 percentage point less than the baseline estimate of 6.55 percent, then the present value of future claim payments would be $267.3 million. The interest rate is used for the purpose of discounting future payments to a present value basis. The higher the interest rate used for discounting, the lower the estimated present value, all other
things being equal. Similarly, the lower the interest rate, the higher the estimated present value. This is because use of a higher interest rate implies that the Fund is able to earn more investment income and, therefore, would need fewer assets as of December 31, 2004, in order to make all future payments. Similarly, a lower interest rate implies that the Fund is able to earn less investment income and, therefore, would need more assets as of December 31, 2004 in order to make all future payments.

This sensitivity test only changes the interest rate. In our actual analysis, inflation rates and the interest rate are related.

**Mortality**

Table 11, below, shows the sensitivity of our estimates, as of December 31, 2004, to the mortality table that is used:

<table>
<thead>
<tr>
<th>Mortality Table</th>
<th>Estimated Future Claim Payments ($ in millions, on a present value basis)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1999 Table</td>
<td>$192.0</td>
</tr>
<tr>
<td>2001 Table</td>
<td>205.8</td>
</tr>
<tr>
<td>2002 Table</td>
<td>212.7</td>
</tr>
<tr>
<td>2003 Table</td>
<td>219.6</td>
</tr>
<tr>
<td>2004 Table</td>
<td>226.5</td>
</tr>
<tr>
<td>2005 Table</td>
<td>240.0</td>
</tr>
<tr>
<td>Blended Table</td>
<td>261.0</td>
</tr>
</tbody>
</table>

Table 11, Column 2 shows that our baseline estimate of future claim payments is $240.0 million, corresponding to the amount shown in Table 1. Table 11 also shows, for example, that if we had not changed from the 2004 Table, which we used in our last study, the estimated present value of future claim payments would be $226.5 million, which is $13.5 million less than our baseline.
estimate of $240.0 million. This lower value would still not be low enough for the Fund to be considered actuarially sound. Similarly, use of the Blended Table would have increased our estimate to $261.0 million.

**Percentage of Insured Claimants Who Have HMO Coverage**

As discussed previously, we estimate the percentage of insured claimants who have HMO coverage as opposed to other forms of coverage. Because we assume that HMOs have no lifetime cap on benefits, our assumption regarding the percentage of insured claimants who have HMO coverage affects our estimates. However, the impact of this assumption is not material. For example, if we assume that 30 percent (rather than 17.5 percent) of insured claimants are insured by HMOs, our estimate of total future payments of the Program, as of December 31, 2004, would be reduced by approximately $1.0 million in total. This value is relatively small (less than one half of one percent of the estimate of future claim payments, as of December 31, 2004, of $240.0 million as shown in Column 3 of Table 1), and also less than the $1.6 million calculated in our September 2004 report.

**Nursing**

This is the major claim payment category, and our forecast of the Program’s future claim payments is very sensitive to our forecast of this item.

As shown earlier in this report, in Table 7, we estimate about $1.4 million per claimant as the present value of future claim payments for this payment category for claimants in Group C. Group C claimants are those who have not yet been admitted to the Program, so this estimate of $1.4 million per claimant can be considered the estimated present value of a claimant’s lifetime costs for nursing care under the Program.

While we have provided for future increases in the utilization of nursing care, there remains significant uncertainty regarding this cost item. Some claimants have little or no nursing costs, whereas others have large nursing costs. For example, during 2004, there were 41 claimants who each had nursing costs that were less than $25,000, and 6 claimants who each had nursing costs in
excess of $200,000. The largest amount paid on behalf of any one claimant for nursing costs in 2004 was $313,800. This probably represents round-the-clock nursing costs.

We include in our estimate an explicit provision of one percent per year for future increases in the utilization of the Program’s nursing services and benefits. Should the future increase in utilization of nursing services and benefits exceed this level, our estimate of the present value of the Fund’s future claims payments is understated. For example, if the utilization of nursing services and benefits were to increase at a rate of two percent per year, our baseline estimate of the present value of the Fund’s future payments would increase by about 10 percent ($24 million) which is comparable to the increase indicated in our September 2004 report as of December 31, 2003.

**Hospital/Physician, Medical Equipment, Incidental, and Prescription Drugs**

These claim payment categories are much smaller than the nursing category but, in our opinion, there is also significant uncertainty regarding the future utilization of services. There are a number of questions regarding future utilization. For example:

- Will utilization increase, decrease, or remain level (as we assume) as the claimants age?

- Will claimants require new and more expensive medical services, equipment, and drugs when they become available?

- Will claimants require increasingly expensive computers (an “incidental” cost), as new designs become available that may be especially useful to the impaired population?

- Will administrative controls be in place that will serve to limit the requests for extraordinary costs?

- Will any restrictions be imposed on future Program claim payments?
Our estimates might prove to be significantly understated, or overstated, depending on the answers to the above questions.

**Housing, Vans, Lost Wages, Legal, Insurance, Medical**

**Review/Intake**
The costs associated with these claim payment categories are fairly well defined and, in our opinion, there is not a significant uncertainty regarding the future claim payments for these payment categories under the current housing provisions.

**Numbers of Eligible Claimants**
Our forecasts of the Fund’s deficit at various points in time are dependent on the assumptions regarding the number of eligible claimants who will eventually be admitted to the Program. Estimates and forecasts of the numbers of eligible claimants who will be admitted are uncertain, for several reasons:

- Claimants can wait for many years before applying to the program, so the number of claimants already born as of any given date, who have not yet been admitted to the Program, is a significant issue.

- The number of eligible claimants born each year is dependent on the numbers of physicians and hospitals participating in the program. Generally, the number of eligible claimants will increase as the numbers of participating physicians and hospitals increase, but the increase in the number of eligible claimants is less than proportional because of the fact that the claimant has to have either been treated by a participating physician or born in a participating hospital. As an example, a ten percent increase in the number of participating physicians would have no impact on the number of eligible claimants if the additional physicians were all working in hospitals that were participating.
- The impact of the legislation effective July 1, 2003 on the number of claimants who will ultimately enter the Program is still unclear. The actual impact of the legislation is uncertain and will only be measurable after several years.

Basically, any increase in the numbers of eligible claimants will have a direct impact on the numbers of claimants admitted to the program, and will therefore increase the costs of the program proportionately. Each additional claimant, beyond what we have estimated, will impact the liabilities of the Fund, and increase the deficit, by approximately $2.0 million.
Changes in Assumptions from Prior Report

As discussed in the preceding text, we have changed many of our assumptions since the time of our September 2004 study. This was not unexpected because we intended to review all of the assumptions and adjust them as appropriate. Many of the assumptions, such as the inflation rates, interest rate, and the amount of annual wage losses, are numbers that we expect to revise, based on updated economic data, each time we update the study. Other assumptions, such as mortality, number of claimants, and claim payment amounts are assumptions that we expect to review at the time of each report, and to revise as appropriate.

The most significant change that we made in this study is the adoption of the 2005 Table for mortality. As indicated in the sensitivity section of this report, in Table 11, this has the impact of increasing our estimate of future claim payments by $13.5 million, all other things being equal. This change, and other changes, are discussed below.
Mortality

We have revised our mortality assumption to anticipate that claimants in the Program will live longer than had been expected at the time of our 2004 study. In this year’s study, we revised the mortality table for all years, which differs from our approach in prior studies in which we only modified mortality for years 15 and over.
Lost Wages

In this year's study, we have revised our methodology for calculating the present value amount for lost wages per Group C claimant to reflect our assumption that the average age of all Group C claimants as of 12/31/04 is approximately 3.5 years old. Based on this assumption for the average age of Group C claimants, we estimate that the average present value of lost wages per Group C claimant is $86,130.
Non-Claimant Administrative Expenses

We have revised our methodology for projecting non-claimant administrative expenses for the years 2005-2007. In last year’s report, we forecasted non-claimant administrative expenses by budgeting on an item-by-item basis. In this report, we project that approximately 20 percent of annual administrative expenses of $650,000, or $130,000 per year, is non-claimant related.
Other Assumptions

There are other assumptions that we revised, as discussed previously in the report:

- We have revised the inflation assumptions to reflect 2004 economic data.

- We have revised the interest rate assumption (discount rate) to reflect 2004 economic data.

- We have revised two assumptions (as discussed in the section of this report titled “Methodology – July 1, 2003 Legislation – Revisited” beginning on page 52) concerning the July 1, 2003 legislation: the number of claimants who we project will receive the $100,000 award, and the calculation of non-claimant administrative expenses. Both have relatively minor impacts on our forecasts.
Background

General

Chapter 50 of Title 38.2 of the Code of Virginia, enacted by the 1987 General Assembly, established the Virginia Birth-Related Neurological Injury Compensation Program. The Program began collecting assessments in late 1987, and the compensation mechanism became effective for births as of January 1, 1988.

Among the stated purposes of the Program is to assure the payment of the financial costs for the lifetime care of infants born with birth-related neurological injuries. The Program is financed by the Virginia Birth-Related Neurological Injury Compensation Fund.

Participation in the Program is optional for both physicians and hospitals. Participating physicians and hospitals receive the benefit of the exclusive remedy provision of the law, and physicians and hospitals that participate are eligible for lower premiums for medical malpractice insurance.
History of Funding

Participating Physicians and Hospitals

Funding for the Program comes from both physicians and hospitals. In addition, the Virginia State Corporation Commission (the SCC) is empowered to assess liability insurers in Virginia up to one-quarter of one percent of net direct liability premiums written in Virginia if needed to maintain the Fund on an actuarially sound basis.

The original schedule of funding assessments for program year 1988 was as follows:

1. Participating physicians paid an annual assessment of $5,000. (The definition of participating physicians was amended in 1989 to include licensed nurse midwives who perform obstetrical services, either full-time or part-time, as authorized in the Plan of Operation. They have been assessed since 1989, but the number of licensed nurse midwives is not material.)

2. Participating hospitals paid an annual assessment equal to $50 per live birth in the previous year, subject to a maximum assessment of $150,000.

Beginning with the 1995 program year, the fixed fee schedules were changed to sliding scale fee schedules under which the fees decreased the longer the participant was in the Program. This fee schedule is shown on Appendix Exhibit 2.

Beginning with the 2001 program year, assessments of participating physicians and hospitals were restored to their original level. For the 2002 program year, assessments of participating physicians and hospitals remain at the original level.

Based upon the July 1, 2004 legislation, assessment income to the Program will increase, effective with the 2005 program year (see section on July 1, 2004 legislation).
Non-Participating Physicians and Liability Insurers

Assessment income of the Program can be modified in a given year in either of the following two ways:

1. Beginning with program year 1993, if the income of the Program is estimated to be in excess of that required for actuarial soundness, income can be reduced by eliminating assessments of non-participating physicians in a given program year. The assessment of non-participating physicians was, in fact, eliminated for program years 1993 through 2001. Assessments of non-participating physicians can be reinstated in any amount up to $250, whenever the SCC determines that such assessment is required to maintain the Fund’s actuarial soundness and the $250 assessments were reinstated beginning with program year 2002 and continuing into program year 2003. Effective with program year 2005, assessments for non-participating physicians will increase (see July 1, 2004 legislation).

2. If the income of the Program is estimated to fall short of that required for actuarial soundness, income can be increased by assessments of liability insurers up to one-quarter of one percent of net direct liability premiums written in Virginia. Insurers were assessed an amount equal to one-tenth of one percent of net direct liability premiums written in Virginia for the 1990 program year, and were assessed one-quarter of one percent of net direct liability premiums written in Virginia beginning with the 2002 program year and continuing into the 2003 program year.

Appendix Exhibit 3 presents a history of the Program’s assessment income. Appendix Exhibit 4 presents a history of the numbers of participating physicians and hospitals.
Eligibility

To be eligible to receive payment from the Program, a claimant must file a claim with the Virginia Workers' Compensation Commission. The Commission must then determine that the claim meets the criteria for reimbursement from the Program. The original law provided that, for a claim to be paid, all three of the following criteria had to be met:

1. The injuries claimed are birth-related neurological injuries as defined in the law,

2. Obstetrical services were performed by a participating physician,

3. The birth occurred in a participating hospital.

Pursuant to Senate Bill 72, the law was amended in 1990 so that criterion 1 and either criterion 2 or 3 must be met for a claim to qualify for payment.
History of Actuarial Studies

An actuarial study of the adequacy of funding of the Program is required to be performed at least once every two years. Mercer RFI provided its initial funding study covering the years 1988 through 1990 on October 13, 1989. We issued three supplemental reports which modified our original funding estimates, as follows:

- First Supplement dated December 22, 1989: Mercer RFI was requested to confer with Dr. Barbara Brown, then of the Williamson Institute for Health Studies, Department of Health Administration, Medical College of Virginia, Virginia Commonwealth University, to determine whether amendments to the Mercer RFI findings (specifically claim frequency) should be considered. As a result, Mercer RFI revised its estimates of the Program's expected frequency and future claim payments.

- Second supplement dated January 24, 1990: Reflected the opinion of the Virginia Attorney General's office that Medicaid would be primary as respects the Program.

- Third supplement dated May 22, 1990: Reflected the effects of Senate Bills 70 and 72. (Pursuant to Senate Bill 70, the original definition of "birth-related neurological injury" was clarified.)

The recommendation in our initial reports was for the assessment of participating and non-participating physicians and participating hospitals, and for an assessment against liability insurance carriers of 0.1 percent of liability premiums for program year 1990.

On March 20, 1991, we issued a report that built on our original work (as amended by our supplementary reports) and provided updated funding estimates for program years 1988 through 1990 and projected estimates for 1991. In that report, we recommended continuation of the assessments of participating hospitals and physicians and non-participating physicians, and no assessment against liability insurance carriers for program year 1991.
On July 17, 1992, we provided revised funding estimates for 1988 through 1991 and projected estimates for 1992 and 1993. In addition, we evaluated the criteria for actuarial soundness of the Program within the context of the law change effective in 1992, which provided that the assessments of non-participating physicians be suspended whenever the Fund was found to be actuarially sound. We recommended that non-participating physicians and liability insurers not be assessed for program year 1993. Accordingly, the SCC suspended the assessment of non-participating physicians.

On September 24, 1993, we provided revised funding estimates for 1988 through 1993 as well as projected estimates for 1994 and 1995. We also recommended that non-participating physicians and liability insurers not be assessed for program years 1994 and 1995.

An amendment to Section 38.2-5016(F) of the Virginia Code was enacted by the 1994 General Assembly Session. The amendment allows the Board of Directors of the Program to reduce the voluntary participating physician and hospital assessments for a stated period of time after the SCC has determined the Program to be actuarially sound. As a result of this amendment, Mercer RFI was requested by the Program to perform an actuarial study to determine: 1) if the Program was still actuarially sound, and 2) if the Program was still actuarially sound, to determine how much the Board of Directors could reduce the annual assessments for participating physicians and hospitals and continue the actuarial soundness of the Program.

Based on a law change in 1994, and following receipt of our report in 1995, the Board of Directors of the Program implemented a sliding scale assessment for participating doctors and hospitals for 1995 based on the number of years of participation in the Program. This reduced the assessment income from those sources by approximately 65 percent. The reduced schedule of assessments is displayed in Appendix Exhibit 2.

In September 1995, we provided estimates of funding for the program years 1988 through 1995, and projections for years 1996 and 1997. In that report, we recommended that the reduced schedule of assessments for participating physicians and participating hospitals continue in 1996 and 1997.
In October 1997, we provided estimates of funding for the program years 1988 through 1997, and projections for years 1998 and 1999. In that report, we had begun to consider housing expenses as non-liquid assets of the Program, rather than costs. This was based on the decision of the Program to establish trust funds for the benefit of the claimants. In our October 1997 report, we recommended that the reduced schedule of assessments for participating physicians and participating hospitals continue in 1998 and 1999.

In December 1999, we provided estimates of funding for the program years 1988 through 1999, and projections for years 2000 and 2001. In that report we observed that, on average, the claimants’ mortality was much better than had been expected. As a result, we made a major change to the mortality assumption, which significantly increased the expected costs per claimant. We estimated that the Program was actuarially sound as of year-end 1999, and recommended that assessments for participating physicians and hospitals, and for non-participating physicians, be restored to their full level.

After release of our December 1999 report, we issued an addendum in which we recommended that:

“If the Fund decides to immediately stop providing cash grants for housing (except for commitments that have already been made and for existing claimants who have not yet received housing benefits) assessments would still have to be restored to their full level for participating hospitals and physicians (but not for non-participating physicians), for program year 2001. Given our current assumptions, this would lead to a $2.1 million deficit for program year 2002 and a $7.1 million deficit by the end of program year 2003. In order to avoid these deficits, there would need to be assessments of the non-participating physicians for program year 2002 and both the non-participating physicians and the liability insurers, for program year 2003.”

In October 2001, we provided estimates of funding for the program years 1988 through 2000, and projections for years 2001, 2002, and 2003. In that report we made significant changes to the estimated number of claimants who would eventually be admitted to the program, to the mortality
table underlying our forecasts, and to the estimated future average annual expenses for admitted claimants. These changes all tended to increase our estimate of the Program’s liabilities, and as a result we estimated that the Fund was not actuarially sound as of December 31, 2000 and forecast that the Fund would not be actuarially sound as of December 31, 2001, 2002, or 2003. Among other things, we recommended that the Program continue to assess participating physicians and hospitals at the maximum level and begin to assess non-participating physicians and liability insurers at the maximum assessment rates.

In September 2002 we provided estimates of funding for the program years 1988 through 2001, and projections for years 2002, 2003, and 2004. We estimated that the Fund was not actuarially sound as of December 31, 2001 and forecast that the Fund would not be actuarially sound as of December 31, 2002, 2003, or 2004. We recommended that the Program continue to assess participating physicians, participating hospitals, non-participating physicians, and liability insurers at the maximum amounts.

In September 2003 we provided estimates of funding for the program years 1988 through 2002, and projections for years 2003, 2004, and 2005. We estimated that the Fund was not actuarially sound as of December 31, 2002 and forecast that the Fund would not be actuarially sound as of December 31, 2003, 2004, or 2005. We recommended that the Program continue to assess participating physicians, participating hospitals, non-participating physicians, and liability insurers at the maximum amounts, and that means be found to increase the funding level.

In September 2004 we provided estimates of funding for the program years 1988 through 2003, and projections for years 2004, 2005, and 2006. We estimated that the Fund was not actuarially sound as of December 31, 2003 and forecast that the Fund would not be actuarially sound as of December 31, 2004, 2005, or 2006. We recommended that the Program continue to assess participating physicians, participating hospitals, non-participating physicians, and liability insurers at the maximum amounts, and that means be found to increase the funding level.

The prior discussion covers the history of the actuarial studies up until this current report.
Limitations and Caveats

Entire Document
The study conclusions are developed in the accompanying text and exhibits, which together comprise the report.

Data Reliance
The data for this study was gathered from several sources, which are detailed in the report. In the study, we relied on the accuracy and completeness of the data without independent audit. If the data are incomplete or inaccurate, our findings and conclusions may need to be revised.

Underlying Assumptions
In addition to the assumptions stated in the report, numerous other assumptions underlie the calculations and results presented herein.

Study Foundations
The study conclusions are based on analysis of the available data and on the estimation of many contingent events. Estimates of future costs were developed from the historical record and from estimated covered exposures.

Statistical Credibility
The statistical credibility of the Program’s experience is not sufficient to evaluate all of the various assumptions, such as the number of claimants, the future annual claim payments, and the life expectancy, with a high degree of confidence. If the number of claimants, future annual claim payments, and mortality experience differ significantly from our estimates, then our estimate of the deficit of the Fund may be significantly understated or overstated.
Uncertainty
For the reasons stated in this report, the conclusions contained in this report are projections of the financial consequences of future contingent events and are subject to a high degree of uncertainty. Due to the uncertainties inherent in the estimation of future costs, it cannot be guaranteed that the estimates set forth in the report will not prove to be inadequate or excessive. Actual costs may vary significantly from our estimates.

Unanticipated Changes
Unanticipated changes in factors such as judicial decisions, legislative actions, the operation of the Program, the utilization of Program benefits and services, and economic conditions may significantly alter the conclusions.

Best Estimates
These caveats and limitations notwithstanding, the conclusions represent our best estimate of the actuarial soundness of the Fund and the funding requirements of the Program at this time.

**Notes:**
These assessments are based upon the contents of HB 1407 and SB 687, effective July 1, 2004.

Under this fee schedule, the assessment of a new participant is prorated based upon when the participant enters the program during the first year of participation.

**Notes:**
1. 1988 - 1994 includes $5,000 per year from participating physicians, $50 per live birth from participating hospitals ($150,000 maximum), and $250 per year from non-participating physicians. Starting in 1995, assessments from non-participating physicians were eliminated.
2. 1990 also includes 0.1% of Virginia liability premiums from liability insurers.
3. Assessments for 1995 through 2000 are according to the length of time the participating physicians and hospitals have been in the program.
4. 2001-2004 include $5,000 each from participating physicians and $50 per live birth from participating hospitals ($150,000 maximum).
   - 2005 is an estimate, based on $5,100 each from participating physicians and $50 per live birth from participating hospitals ($160,000 maximum).
5. 2002 and 2003 also includes 0.25% of Virginia liability premiums from liability insurers.

1988 through 1998 values: from December.
1999 through 2001 values: provided by the Program.
2002 value: calculated by Mercer based upon information provided by the Program.
2003 value: the actual number of physicians, before pro-rata, was 384.
2004 value: the actual number of physicians, before pro-rata, was 495.
2005 value: based on discussions with management of the Program, we estimate the number of pro-rata physicians will be 468 and that the number of physicians before pro-rata will be 496.

* Excludes non-assessed residents. The number of participating physicians represents the equivalent number of physicians in the Program for a full year. In other words, one physician in the Program for six months would count as 0.5 physicians.
Reconciliation of Estimated Future Claim Payments, From 12/31/05 to 12/31/06
(All Values are in Millions)

Admitted Claimants as of 12/31/06

A. Estimated future payments for claimants admitted as of 12/31/05 (Table 2): $166.0

Plus:

B. One year's interest on Item A: $10.9

C. Estimated future payments for claimants admitted during 2006, prior to adjustments for claims paid during 2006: $20.1

D. Total additions to future claim payments (B+C): $31.0

Less:

E. Estimated claim payments made in 2006: -$13.4

F. Estimated value of future payments for admitted claimants as of 12/31/06 (Table 3) (A+D+E) $183.6

Not-Yet-Admitted Claimants

G. Estimated future payments for claimants not yet admitted as of 12/31/05 (Table 2): $96.5

Plus:

H. One year's interest on Item G: $6.3

I. Estimated future payments for claimants born in 2005: $22.3

J. Total additions to future claim payments: $28.6

Less:

K. Claimants not-yet-admitted at 12/31/05, but admitted at 12/31/06: (valued as of 12/31/06) -$20.1

L. Estimated future payments for claimants not yet admitted as of 12/31/06 (Table 3) (G+J+K): $105.0

Notes:

A. From Table 2; this is the starting point in our reconciliation of the future claim payments for admitted claimants.
B. Because item A was discounted as of 12/31/05, the discount must be "unwound" to determine the value as of 12/31/06. This is the amount by which the discount must be "unwound."
C. We must add the value of the future costs for claimants admitted during 2006, because item A only includes claimants admitted as of 12/31/05.
D. =B + C.
E. We must deduct the estimate of the claim payments made during 2006, because these are otherwise included in items A and C.
F. = A + D + E, and reconciles to Table 3.
G. From Table 2; this is the starting point in our reconciliation of the future claim payments for not-yet-admitted claimants.
H. Because item G was discounted as of 12/31/05, the discount must be "unwound" to determine the value as of 12/31/06. This is the amount by which the discount must be "unwound."
I. We must add the value of the future costs for claimants born during 2006, because item G only includes claimants born as of 12/31/05.
J. =H + I.
K. We must deduct the estimated future claim payments for claimants not yet admitted as of 12/31/05, but admitted during the year 2006. Otherwise, their future costs would be double-counted, because they are included in item C.
L. = G + J + K, and reconciles to Table 3.

This Appendix is a simplification of the actual process we use to determine the values presented in Tables 1-4.
Reconciliation of Estimated Future Asset Values, From 12/31/05 to 12/31/06
(All Values are in Millions)

A. Liquid plus Non-Liquid Assets as of 12/31/05 (Table 2): $145.8

    Plus

B. Interest in 6/30/06 on Liquid Assets: 4.8
    Assessments:
    C. Participating Hospitals: 2.8
    D. Participating Physicians: 2.4
    E. Non-Participating Physicians: 3.7
    F. Liability Insurers: 12.4

    Total Assessments (prior to interest accrual): 21.3
    Interest Accrual on Assessments to 6/30/06: 0.7
    Total Additions to 6/30/06: 26.8

    Less

    Payments made on 6/30/06:
    J. Non-Claimant Related: 0.134
    K. Claimant Related: 11.2
    Total Payments at 6/30/06: -11.3

    Plus

    Interest Accrual on Assets to 12/31/06:
    M. On Liquid Assets - from 6/30/06: 5.1
    N. On Non-Liquid Assets - from 12/31/05: 0.0
    O. Total: (M+N) 5.1

    P. Liquid plus Non-Liquid Assets as of 12/31/06 (Table 3): $166.4
       (A+I+L+O)
